

Supplementary materials for Mustafin et al. "Phylostratigraphic Analysis Shows the Earliest Origination of the Abiotic Stress Associated Genes in *A. thaliana*"

Gene ontology terms associated with stress-associated genes obtained using DAVID server.

Columns explanation:

Stress – the name of the stress genes associated with.

Term – the ID and the name of term (separated by ~).

Count – the number of genes associated with term.

% - the proportion (in %) of genes associated with this GO compared to total number genes in cluster.

PValue - The threshold of EASE Score, a modified Fisher Exact P-Value, for gene-enrichment analysis. It ranges from 0 to 1. Fisher Exact P-Value = 0 represents perfect enrichment. Usually P-Value is equal or smaller than 0.05 to be considered strongly enriched in the annotation categories.

Genes – the list of genes associated with GO term.

List Total – the number of genes in stress dataset.

Pop Hits – how many have the function name in gene list of interest.

Pop Total – how many genes in GO dictionary (on the top of table) has that function name in the background genome.

Fold Enrichment – measure the magnitude of enrichment. Fold enrichment along with EASE score could rank the enriched terms in a more comprehensive way.

Bonferroni – one of the correction's of the enrichment's P-values to control family-wide false discovery rate.

Benjamini – one of the correction's of the enrichment's P-values to control family-wide false discovery rate.

FDR (False discovery rate) - represents the percentages of test which might be false positive.

Stress	Term	Count	%	PValue	Genes	List Total	Pop Hits	Pop Total	Fold Enrichment	Bonferroni	Benjamini	FDR
