

Supplementary Information for

Seasonal Adaptation: Geographic Photoperiod-Temperature Patterns Explain Genetic Variation in the Common Vole Tsh Receptor

Laura van Rosmalen ^{1,†}, Robin Schepers ¹, Wensi Hao ¹, Anna S. Przybylska-Piech ^{1,‡}, Jeremy S. Herman ², Joanna Stojak ^{3,4}, Jan M. Wójcik ³, Louis van de Zande ⁵, Jeremy B. Searle ^{6,*} and Roelof A. Hut ¹

This PDF file includes:

Figures S1 to S3

Tables S1 to S7

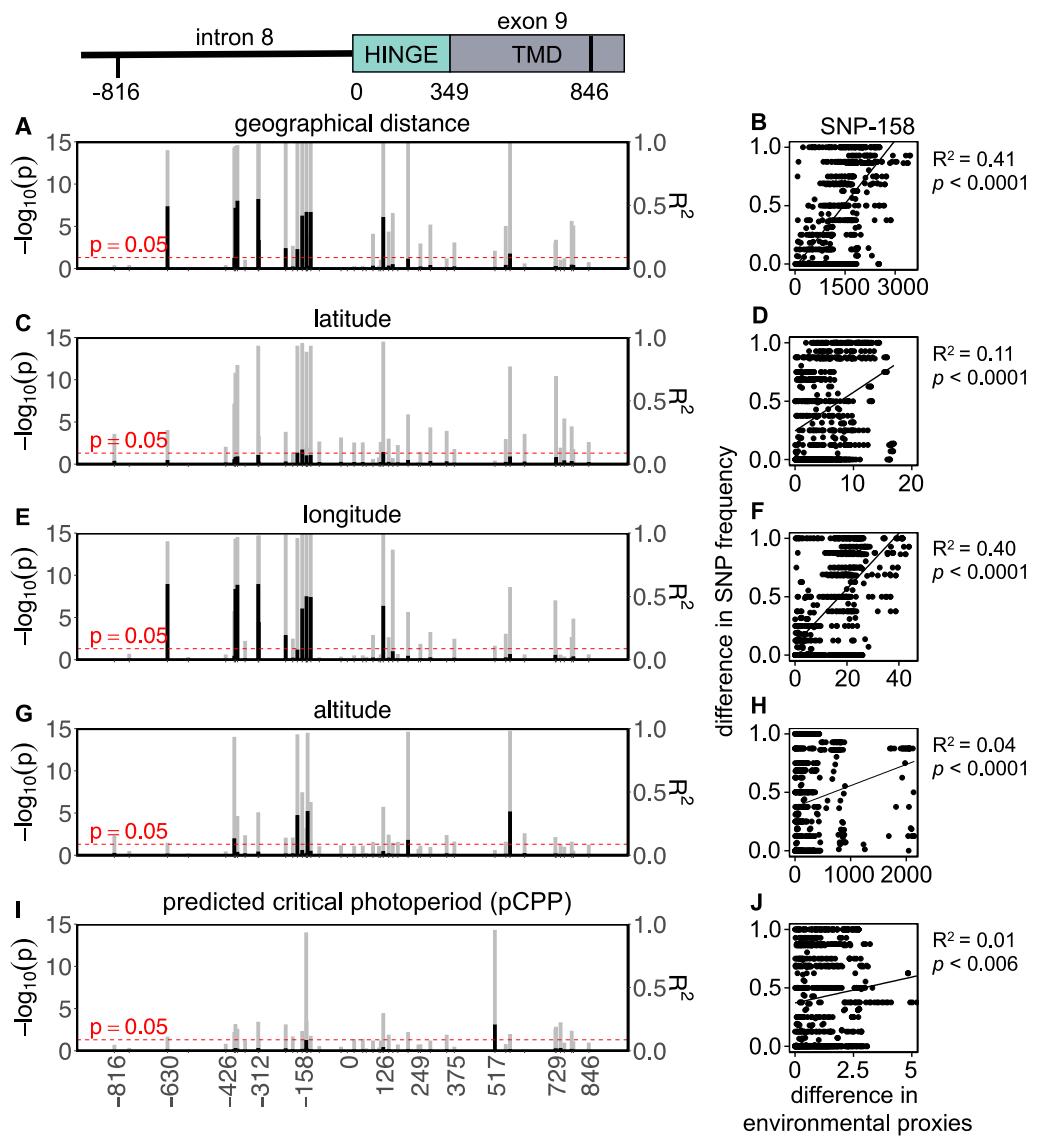

Figure S1. *Tsh* mutations in Western and Eastern European common vole populations. Manhattan-type plots ($-\log_{10}(p)$) for the sequenced *Tsh* region for (A) geographical distance, (C) latitude, (E) longitude, (G) altitude and (I) predicted critical photoperiod (pCPP). Grey bars indicate Benjamini-Hochberg adjusted p-values, black bars indicate R^2 -values. SNPs that meet the threshold for

significant correlations ($p < 0.05$) cross the red dashed line. Pairwise difference in SNP frequency for one representative mutations (SNP-158) related to (B) pairwise geographical distance, (D) pairwise latitudinal difference, (F) pairwise longitudinal difference, (H) pairwise altitudinal difference and (J) pairwise difference in pCPP. Significant correlations are indicated by linear regression lines. All statistic results of linear models for SNP frequency related to environmental proxies can be found in Table S5.

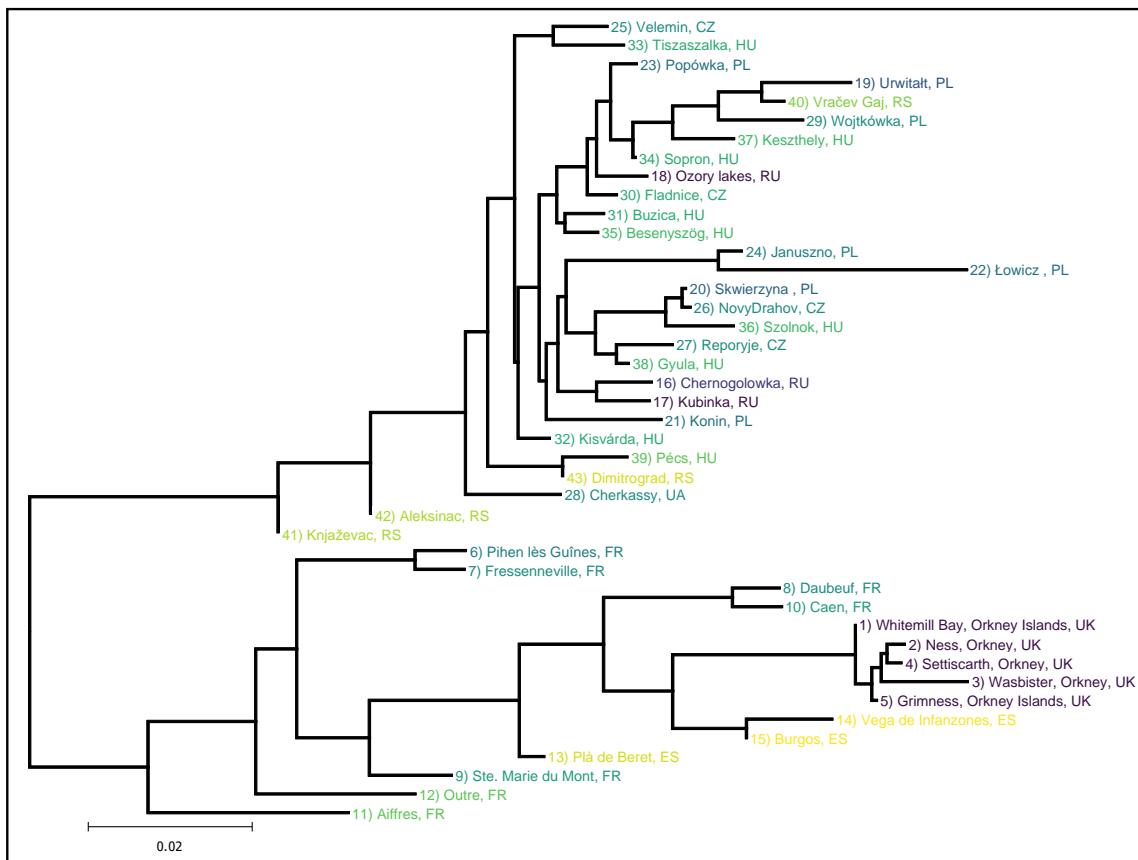

Figure S2. A distance-based phylogenetic tree for the sequenced Tshzr region, inferred with the neighbor-joining method. Populations are labelled using region names (see Fig. 1 and Table S1). Colors indicate latitude as in Figure 1A, ranging from 42°N (yellow) to 59°N (purple).

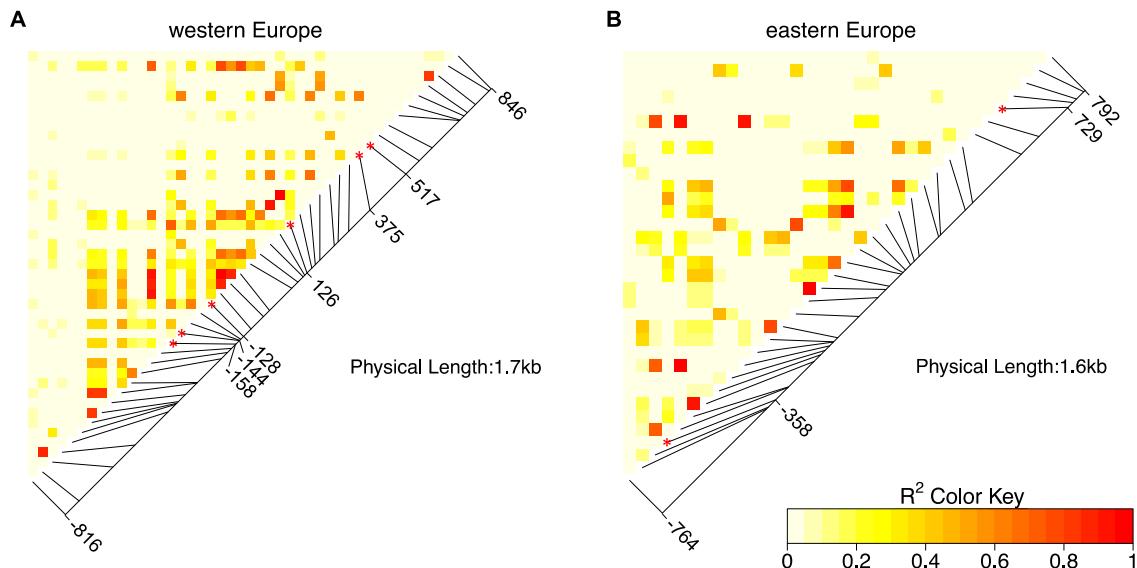

Figure S3. Pairwise linkage disequilibrium heatmaps. Patterns of linkage disequilibrium between SNPs within the sequenced Tshz region for (A) Western and (B) Eastern European samples. Colors indicate R^2 -values for pairwise correlations, varying between 0 (white) and 1 (red). Mutations with SNP frequencies that significantly correlate with local temperature thresholds are marked with red asterisks.

Table S1. List of locations where *M. arvalis* specimens were obtained (country codes: CZ - Czech Republic, ES - Spain, FR - France, HU - Hungary, PL - Poland, RS - Serbia, RU - Russia, UA - Ukraine, UK - Great Britain), pCPP – predicted critical photoperiod.

Table S2. Primer sequences used for amplification (PCR) and Sanger sequencing of the *Tshsr* gene of the common vole.

Gene	Forward primer ('5-'3)	Reverse primer ('5-'3)	Product size (bp)
<i>Tshsr</i> intron8	GGTGGAAAAGATGGCTCGAA	GGAGCCCCCTTAAACTCTGGG	1102
<i>Tshsr</i> exon9-1	TTGGAGTGATTCTGACTAGG	TATCGCGAGGGTTGTACT	1208

Table S3. Thermal cycling conditions for PCR.

PCR step	T (°C)	Duration (seconds)	Cycles
Initial denaturation	95	120	
Denaturation	95	30	35
Annealing	60	30	
Extension	72	60	
Final extension	72	420	
	4	<24h	

Table S4. Nucleotide and predicted amino acid sequence of the end of intron 8 and the beginning of exon 9 of the common vole *Tshsr*. SNPs shown in red.

Table S5. Statistical output for linear models relating pairwise distances of allele frequencies to pairwise difference in environmental proxies (geographical distance, latitude, longitude, altitude and pCPP) in Eastern and Western Europe. SNP loc.: location of SNP relative to intron 8 – exon 9 boundary. SNP: changed nucleotides. Amino acid: changed amino acids are indicated with an asterisk. FST: F-statistic reflecting overall degree of genetic differentiation. pCPP: predicted critical photoperiod. p.adj: Benjamini-Hochberg adjusted p-value. Significant correlations are marked with an asterisk ($p < 0.05$).

Table S6. Statistical output for linear models relating pairwise distances of allele frequencies to pairwise difference in environmental proxies (geographical distance, latitude, longitude, altitude and pCPP) in Western Europe. SNP loc.: location of SNP relative to intron 8 – exon 9 boundary. SNP: changed nucleotides. Amino acid: changed amino acids are indicated with an asterisk. FST: F-statistic reflecting overall degree of genetic differentiation. pCPP: predicted critical photoperiod. p.adj: Benjamini-Hochberg adjusted p-value. Significant correlations are marked with an asterisk ($p < 0.05$).

Table S7. Statistical output for linear models relating pairwise distances of allele frequencies to pairwise difference in environmental proxies (geographical distance, latitude, longitude, altitude and pCPP) in Eastern Europe. SNP loc.: location of SNP relative to intron 8 – exon 9 boundary. SNP: changed nucleotides. Amino acid: changed amino acids are indicated with an asterisk. Fst: F-statistic reflecting overall degree of genetic differentiation. pCPP: predicted critical photoperiod. *p*.adj: Benjamini-Hochberg adjusted *p*-value. Significant correlations are marked with an asterisk (*p*<0.05).
