

Supplementary Materials: Quantification and Characterization of Metals in Ultrafine Road Dust Particles

Suzanne Beauchemin^{1,*}, Christine Levesque¹, Clare L.S. Wiseman^{2,3,4}, Pat E. Rasmussen¹ and ⁵

Table S1. QA/QC for ICP measurements of certified reference materials; mean concentrations and standard deviation (sd) obtained using ICP-MS unless indicated otherwise. Percent recoveries are calculated based on certified values unless indicated otherwise. All concentrations are in mg kg⁻¹.

	NIST 1648 (n=12 ^d)			NIST 2557 (n=15 ^d)			NIST 2584 (n=9 ^d)			NIST 2711 (n=15 ^d)			BCR-723 (n=15 ^d)

^a Measured concentrations obtained by ICP-OES

^b % recovery calculated based on the indicative values. NA: no certified or indicative value available

^c LOD = Limits of detection calculated as 3 times the standard deviation of 21 procedural blanks for ICP-MS and 27 for ICP-OES

^d Max number of replicates with the following exceptions: (i) Cu n=6 for all CRMs; (ii) Si n=9 for NIST 2557, NIST 2711 and BCR; n=6 for NIST 1648 and n=3 for NIST 2584; (iii) Ti and Zn n=13 for NIST 2557, NIST 2711 and BCR; n=7 for NIST 2584 and n=10 for NIST 164

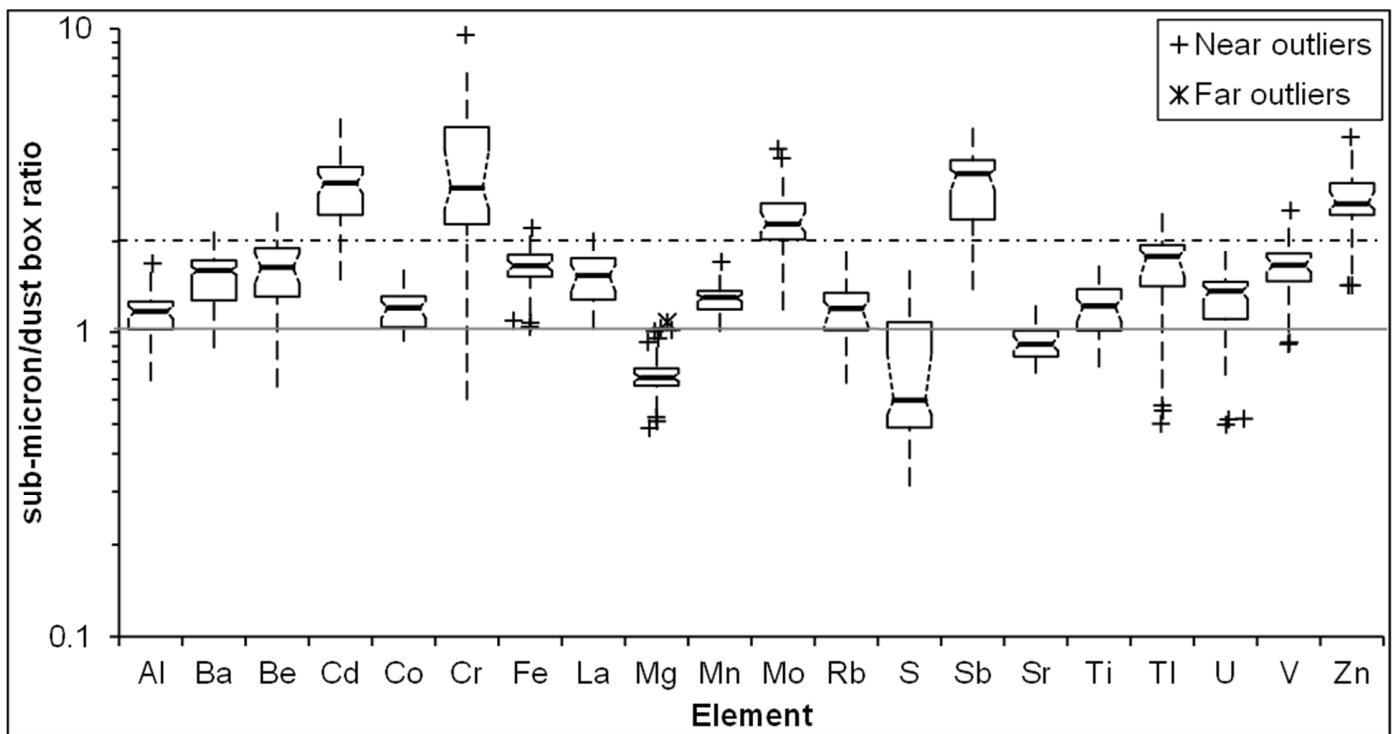

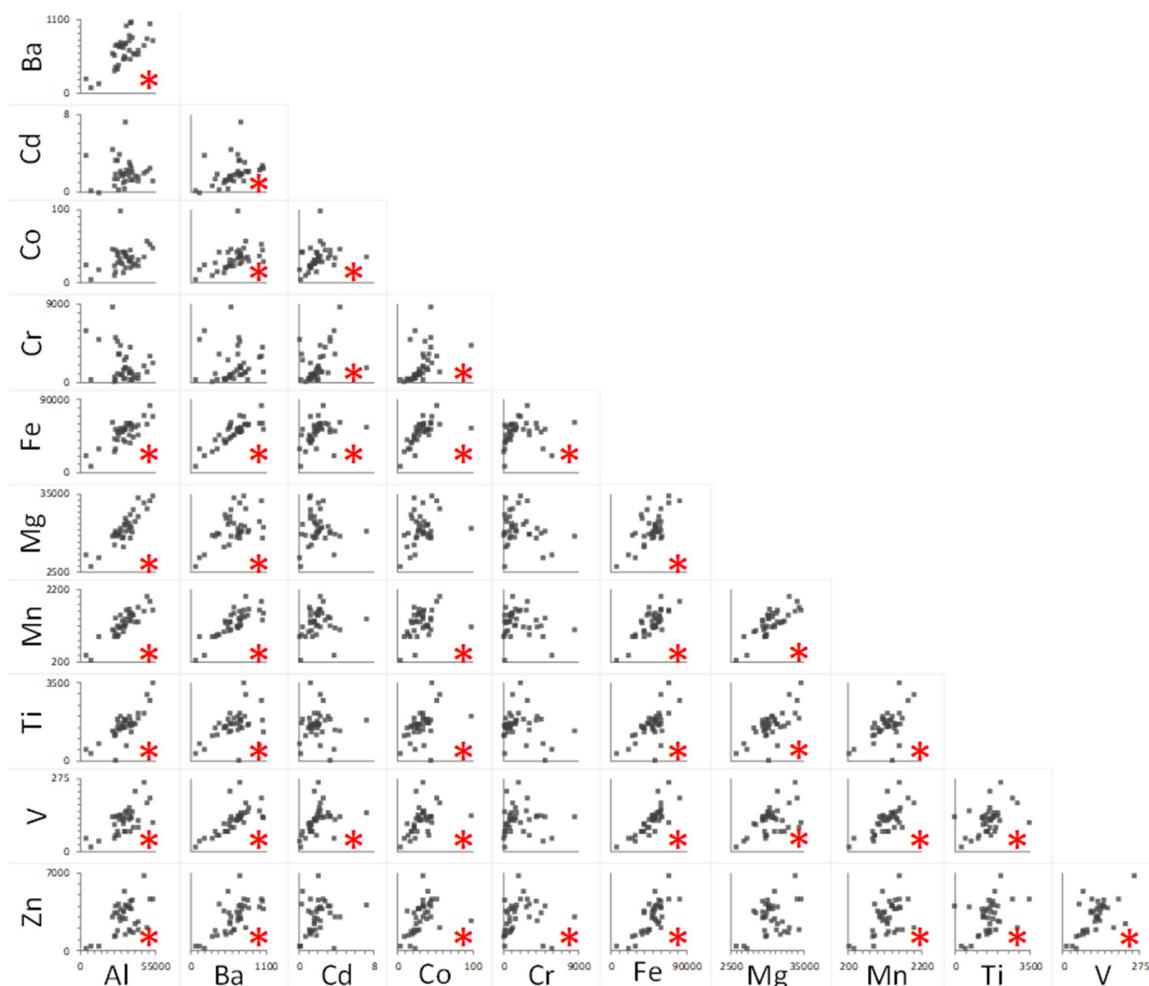

Figure S1. Ratios of element concentrations in the aerosolized sub-micron fractions compared to the dust box considering all six road dust samples (sub-micron/dust box ratio); each box plot shows the median within the 25th and 75th percentile box, dispersion extending 1.5*IQR from each quartile, as well as near (> 1.5 IQR) and far (> 3 IQR) outliers. The 95% confidence interval for the median is plotted as a notch on the box. Plain and dotted lines at sub/dust box ratio = 1 or 2 respectively are visual guidelines. Cu, Sn, Pb, Ni, Bi and As were not included in the analysis due to potential cross-contamination from the bronze beads. Ag, Bi, Zr, B, Ce, Se and Si were not included because $> 50\%$ of the values in the sub-micron and nano fractions were < LOD.

Figure S2. Scatterplot matrix showing the correlation between concentrations of various key elements in the nano-scale dust fractions ($n=35$); “**” indicate significant Spearman’s correlations at a 5% significance level (2-sided Fisher’s test); correlation coefficients reported in the accompanying table.
