### The Relationship between L-Moments and LH-Moments

Relations for LH-moments [16]:

$$L_1^\eta = E[X_{(\eta+1);(\eta+1)}]$$

$$L_2^\eta = \frac{1}{2} \cdot E[X_{(\eta+2);(\eta+2)} - X_{(\eta+1);(\eta+2)}]$$

$$L_3^\eta = \frac{1}{3} \cdot E[X_{(\eta+3);(\eta+3)} - 2 \cdot X_{(\eta+2);(\eta+3)} + X_{(\eta+1);(\eta+3)}]$$

$$L_4^\eta = \frac{1}{4} \cdot E[X_{(\eta+4);(\eta+4)} - 3 \cdot X_{(\eta+3);(\eta+4)} + 3 \cdot X_{(\eta+2);(\eta+4)} - X_{(\eta+1);(\eta+4)}]$$

where  $\eta = 0, 1, 2, 3, \dots$ . For  $\eta = 0$ , the method is identical to the L-moments method.

Based on these LH-moments, the statistical indicators are:

$$\tau_{H2} = \frac{L_2^\eta}{L_1^\eta} - \text{represents coefficient of LH-variation}$$

$$\tau_{H3} = \frac{L_3^\eta}{L_2^\eta} - \text{represents LH-skewness}$$

$$\tau_{H4} = \frac{L_4^\eta}{L_2^\eta} - \text{represents LH-kurtosis}$$

The relations between the high-order linear moments and the normalized weighted moments are the following:

$$L_1^\eta = B_\eta$$

$$L_2^\eta = \frac{(\eta+2)}{2} \cdot (B_{\eta+1} - B_\eta)$$

$$L_3^\eta = \frac{(\eta+3)}{6} \cdot ((\eta+4) \cdot B_{\eta+2} - 2 \cdot (\eta+3) \cdot B_{\eta+1} + (\eta+2) \cdot B_\eta)$$

$$L_4^\eta = \frac{(\eta+4)}{24} \cdot \left( (\eta+6) \cdot (\eta+5) \cdot B_{\eta+3} - 3 \cdot (\eta+5) \cdot (\eta+4) \cdot B_{\eta+2} + 3 \cdot (\eta+4) \cdot (\eta+3) \cdot B_{\eta+1} - (\eta+3) \cdot (\eta+2) \cdot B_\eta \right)$$

where  $B_\eta = (\eta+1) \cdot b_\eta$  and  $b_\eta$  represent the natural estimators expressed by the L-moments method. For  $\eta = 0$ , the method become the L-moments method.

### The second LH-moments for the GEV, W3, PG, LL3 and RY distributions

#### GEV distribution

$$L_{H1} = \gamma + \frac{\beta}{\alpha} \cdot (1 - \Gamma(1+\alpha) \cdot 3^{-\alpha})$$

$$L_{H_3} = \frac{5}{3} \cdot \beta \cdot \Gamma(\alpha) \cdot (5 \cdot 4^{-\alpha} - 2 \cdot 3^{-\alpha})$$

Parameter  $\alpha$  can be approximate using the next relation depending on  $\tau_{H_3}$ :

$$\alpha = \frac{0.590985391 - 2.285515331 \cdot |\tau_{H_3}| + 0.427911532 \cdot \tau_{H_3}^2}{1 + 0.082080011 \cdot |\tau_{H_3}| - 0.081733267 \cdot \tau_{H_3}^2 + 0.008299996 \cdot |\tau_{H_3}|^3}$$

$$\beta = \frac{L_{H_2}}{2 \cdot \Gamma(\alpha) \cdot (3^{-\alpha} - 4^{-\alpha})}$$

If  $0.40 < |\tau_{H_3}| < 0.83$ :

$$\alpha = 7.52721198 - 51.23777768 \cdot |\tau_{H_3}| + 166.95004129 \cdot \tau_{H_3}^2 - 297.93483838 \cdot |\tau_{H_3}|^3 + 288.77916443 \cdot \tau_{H_3}^4 - 135.39865923 \cdot |\tau_{H_3}|^5 + 20.62550348 \cdot \tau_{H_3}^6$$

$$\beta = \frac{L_{H_2} \cdot \alpha}{2 \cdot 6^{-\frac{1}{\alpha}} \cdot \Gamma\left(\frac{1}{\alpha}\right) \cdot \left(6^{\frac{1}{\alpha}} + 3 \cdot 2^{\frac{1}{\alpha}} - 3^{\frac{1}{\alpha}} \cdot \left(2^{\frac{1}{\alpha}} + 3\right)\right)}$$

$$\gamma = L_{H_1} + \frac{\beta}{\alpha} \cdot 6^{-\frac{1}{\alpha}} \cdot \Gamma\left(\frac{1}{\alpha}\right) \cdot \left(3^{\frac{1}{\alpha}+1} - 3 \cdot 6^{\frac{1}{\alpha}} - 2^{\frac{1}{\alpha}}\right)$$
