

Figure S2: CDC of BCMAxPDL1 bsAb in absence of the γ -secretase inhibitor DAPT.
The BJAB-mBCMA+ cell line was incubated with increasing concentrations of bsAb, mAbs or rituximab (RTX) as positive control and in the presence of 50% HS as a source of complement. BJAB-mBCMA+ cell line was not incubated overnight with DAPT before the experiments. CDC was measured after 4 h by 7-AAD staining and flow cytometry. *:p \leq 0.05 vs No mAb.
