Abstract: In this paper, we extend the rough set model on two different universes in intuitionistic fuzzy approximation spaces to a single-valued neutrosophic environment. Firstly, based on the \((\alpha, \beta, \gamma)\)-cut relation \(\widetilde{R}\)\((\alpha, \beta, \gamma)\), we propose a rough set model in generalized single-valued neutrosophic approximation spaces. Then, some properties of the new rough set model are discussed. Furthermore, we obtain two extended models of the new rough set model—the degree rough set model and the variable precision rough set model—and study some of their properties. Finally, we explore an example to illustrate the validity of the new rough set model.

Keywords: neutrosophic sets; single-valued neutrosophic sets; generalized single-valued neutrosophic approximation spaces; rough sets; single-valued neutrosophic relations

1. Introduction

Smarandache [1,2] introduced the concept of the neutrosophic set (NS), which consists of three membership functions (truth membership function, indeterminacy membership function and falsity membership function), where each function value is a real standard or nonstandard subset of the nonstandard unit interval \([0^-, 1^+]\). The neutrosophic set generalizes the concepts of the classical set, fuzzy set [3], interval-valued fuzzy set [4], intuitionistic fuzzy set [5] and interval-valued intuitionistic fuzzy set [6]. The neutrosophic set model is an important tool for dealing with real scientific and engineering applications because it can handle not only incomplete information, but also the inconsistent information and indeterminate information that exist commonly in real situations.

For easily applying NSs in the real world, Smarandache [1] and Wang et al. [7] proposed single-valued neutrosophic sets (SVNSs) by simplifying NSs. SVNSs can also be seen as an extension of intuitionistic fuzzy sets [5], in which three membership functions are unrelated and their function values belong to the unit closed interval. SVNSs has been a hot research issue. Ye [8,9] proposed decision making based on correlation coefficients and weighted correlation coefficients of SVNSs and illustrated the application of the proposed methods. Baušys et al. [10] applied SVNSs to multi-criteria decision making and proposed a new extension of the crisp complex proportional assessment (COPRAS) method named COPRAS-SVNS. Zavadskas et al. [11] applied SVNSs to the weighted aggregated sum product assessment (WASPAS) method, named WASPAS-SVNS, and used the new method to solve sustainable assessment of alternative sites for the construction of a waste incineration plant. Zavadskas et al. [12] also applied WASPAS-SVNS to the selection of a lead-zinc flotation circuit design. Zavadskas et al. [13] proposed a single-valued neutrosophic multi-attribute market value assessment method and applied this method to the sustainable market valuation of...

Rough set theory, initiated by Pawlak [27,28], is a mathematical tool for the study of intelligent systems characterized by insufficient and incomplete information. The theory has been successfully applied to many fields, such as machine learning, knowledge acquisition, decision analysis, etc. To extend the application domain of rough set theory, more and more researchers have made some efforts toward the study of rough set models based on two different universes [29–39].

In recent years, many researchers have paid attention to combining neutrosophic sets with rough sets. Salama and Broumi [40] investigated the roughness of neutrosophic sets. Broumi and Smarandache put forward rough neutrosophic sets [41,42], as well as interval neutrosophic rough sets [43]. Yang et al. [44] proposed single-valued neutrosophic rough sets, which comprise a hybrid model of single-valued neutrosophic sets and rough sets. Along this line, this paper attempts to do some work regarding the fusion of single-valued neutrosophic sets and rough sets again. Concretely, we will extend the rough set model in [29] to a single-valued neutrosophic environment. Furthermore, we will apply the new model to a multi-attribute decision making problem.

The rest of this paper is organized as follows. In Section 2, we recall some basic notions related to Pawlak rough sets, SVNSs and single-valued neutrosophic rough sets. In Section 3, we propose a rough set model in generalized single-valued neutrosophic approximation spaces. Section 4 gives two extended models and studies some related properties. Section 5 explores an example to illustrate the new rough set model’s application in multi-attribute decision making. The last section summarizes the conclusions.

2. Preliminaries

In this section, we recall some basic notions of Pawlak rough sets, SVNSs and single-valued neutrosophic rough sets.
2.1. Pawlak Rough Sets

**Definition 1.** ([27,28]) Let \( U \) be a nonempty finite universe and \( R \) be an equivalence relation in \( U \). \((U, R)\) is called a Pawlak approximation space. \( \forall X \subseteq U \), the lower and upper approximations of \( X \), denoted by \( \underline{R}(X) \) and \( \overline{R}(X) \), are defined as follows, respectively:

\[
\underline{R}(X) = \{ x \in U \mid [x]_R \subseteq X \}, \\
\overline{R}(X) = \{ x \in U \mid [x]_R \cap X \neq \emptyset \},
\]

where \([x]_R = \{ y \in U \mid (x, y) \in R \} \). \( \underline{R} \) and \( \overline{R} \) are called the lower and upper approximation operators, respectively. The pair \((\underline{R}(X), \overline{R}(X))\) is called a Pawlak rough set.

Furthermore, the positive region, boundary region and negative region of the subset \( X \) are defined by

\[
\text{pos}(X) = \underline{R}(X), \quad \text{neg}(X) = U - \overline{R}(X), \quad \text{bn}(X) = \overline{R}(X) - \underline{R}(X).
\]

2.2. Single-Valued Neutrosophic Sets and Single-Valued Neutrosophic Rough Sets

**Definition 2.** ([7]) Let \( U \) be a space of points (objects), with a generic element in \( U \) denoted by \( x \). A SVNS \( \bar{A} \) in \( U \) is characterized by three membership functions, a truth membership function \( T_{\bar{A}} \), an indeterminacy membership function \( I_{\bar{A}} \) and a falsity membership function \( F_{\bar{A}} \), where \( \forall x \in U, T_{\bar{A}}(x), I_{\bar{A}}(x), F_{\bar{A}}(x) \in [0, 1] \).

The SVNS \( \bar{A} \) can be denoted by \( \bar{A} = \{ \langle x, T_{\bar{A}}(x), I_{\bar{A}}(x), F_{\bar{A}}(x) \rangle \mid x \in U \} \) or \( \bar{A} = (T_{\bar{A}}, I_{\bar{A}}, F_{\bar{A}}) \).

**Definition 3.** ([44]) An SVNS \( \bar{R} \) in \( U \times U \) is called a single-valued neutrosophic relation (SVNR) in \( U \), denoted by \( \bar{R} = \{ ((x, y), T_{\bar{R}}(x, y), I_{\bar{R}}(x, y), F_{\bar{R}}(x, y)) \mid (x, y) \in U \times U \} \), where \( T_{\bar{R}} : U \times U \rightarrow [0, 1], I_{\bar{R}} : U \times U \rightarrow [0, 1] \) and \( F_{\bar{R}} : U \times U \rightarrow [0, 1] \) denote the truth membership function, indeterminacy membership function and falsity membership function of \( \bar{R} \), respectively.

**Definition 4.** ([45]) Let \( \bar{R}, \bar{S} \) be two SVNRs in \( U \). If \( \forall x, y \in U, T_{\bar{R}}(x, y) \leq T_{\bar{S}}(x, y), I_{\bar{R}}(x, y) \geq I_{\bar{S}}(x, y) \) and \( F_{\bar{R}}(x, y) \geq F_{\bar{S}}(x, y) \), then we say \( \bar{R} \) is contained in \( \bar{S} \), denoted by \( \bar{R} \subseteq \bar{S} \). In other words, we say \( \bar{S} \) contains \( \bar{R} \), denoted by \( \bar{S} \supseteq \bar{R} \).

**Definition 5.** ([24]) Let \( \bar{R} \) be an SVNR in \( U \). If \( \forall x \in U, T_{\bar{R}}(x, x) = 1 \) and \( I_{\bar{R}}(x, x) = F_{\bar{R}}(x, x) = 0 \), then \( \bar{R} \) is called a reflexive SVNR. If \( \forall x, y \in U, T_{\bar{R}}(x, y) = T_{\bar{R}}(y, x) \), then \( \bar{R} \) is called a symmetric SVNR.

If \( \forall x \in U, V_{y \in U} T_{\bar{R}}(x, y) = 1 \) and \( \Lambda_{y \in U} I_{\bar{R}}(x, y) = \Lambda_{y \in U} F_{\bar{R}}(x, y) = 0 \), then \( \bar{R} \) is called a serial SVNR. If \( \forall x, y, z \in U, V_{y \in U} (T_{\bar{R}}(x, y) \land T_{\bar{R}}(y, z)) \leq T_{\bar{R}}(x, z), \Lambda_{y \in U} (I_{\bar{R}}(x, y) \lor I_{\bar{R}}(y, z)) \geq I_{\bar{R}}(x, z) \) and \( \Lambda_{y \in U} (F_{\bar{R}}(x, y) \lor F_{\bar{R}}(y, z)) \geq F_{\bar{R}}(x, z) \), then \( \bar{R} \) is called a transitive SVNR, where \( \land \) and \( \lor \) denote maximum and minimum, respectively.

**Definition 6.** ([24]) Let \( \bar{R} \) be an SVNR in \( U \); the tuple \((\bar{U}, \bar{R})\) is called a single-valued neutrosophic approximation space. \( \forall \bar{A} \in \text{SVNS}(U) \), the lower and upper approximations of \( \bar{A} \) w.r.t. \((\bar{U}, \bar{R})\), denoted by \( \underline{T}_{\bar{R}}(\bar{A}) \) and \( \overline{T}_{\bar{R}}(\bar{A}) \), are two SVNSs whose membership functions are defined as: \( \forall x \in U, \)

\[
\underline{T}_{\bar{R}}(\bar{A})(x) = \Lambda_{y \in U} (F_{\bar{R}}(x, y) \lor I_{\bar{A}}(y)), \\
I_{\bar{R}}(\bar{A})(x) = V_{y \in U} ((1 - I_{\bar{R}}(x, y)) \land I_{\bar{A}}(y)), \\
F_{\bar{R}}(\bar{A})(x) = V_{y \in U} (T_{\bar{R}}(x, y) \land F_{\bar{A}}(y)); \\
\overline{T}_{\bar{R}}(\bar{A})(x) = V_{y \in U} (T_{\bar{R}}(x, y) \land T_{\bar{A}}(y)), \\
I_{\bar{R}}(\bar{A})(x) = \Lambda_{y \in U} (I_{\bar{R}}(x, y) \lor I_{\bar{A}}(y)), \\
F_{\bar{R}}(\bar{A})(x) = \Lambda_{y \in U} (F_{\bar{R}}(x, y) \lor F_{\bar{A}}(y)).
\]
The pair \((\tilde{R}(\tilde{A}), \widetilde{R}(\tilde{A}))\) is called the single-valued neutrosophic rough set of \(\tilde{A}\) w.r.t. \((U, \widetilde{R})\). \(\tilde{R}\) and \(\widetilde{R}\) are referred to as the single-valued neutrosophic lower and upper approximation operators, respectively.

3. Rough Set Model in Generalized Single-Valued Neutrosophic Approximation Spaces

Guo et al. [29] studied the rough set model on two different universes in intuitionistic fuzzy approximation space. In this section, we will extend the rough set model in [29] to a single-valued neutrosophic environment.

Yang et al. [24] proposed the notions of single-valued neutrosophic relations from \(U\) to \(V\) and generalized single-valued neutrosophic approximation spaces as follows.

**Definition 7.** ([24]) Let \(U\) and \(V\) be two nonempty finite universes. The relation \(\tilde{R}\) in \(U \times V\) is called a single-valued neutrosophic relation from \(U\) to \(V\), denoted by \(\tilde{R} = \{((x, y), T^\tilde{R}(x, y), I^\tilde{R}(x, y), F^\tilde{R}(x, y)) | (x, y) \in U \times V\}\), where \(T^\tilde{R}: U \times V \rightarrow [0, 1]\), \(I^\tilde{R}: U \times V \rightarrow [0, 1]\) and \(F^\tilde{R}: U \times V \rightarrow [0, 1]\) denote the truth membership function, indeterminacy membership function and falsity membership function of \(\tilde{R}\), respectively.

The triple \((U, V, \tilde{R})\) is called a generalized single-valued neutrosophic approximation space on two different universes.

**Remark 1.** If \(U = V\), then we call \(\tilde{R}\) a single-valued neutrosophic relation in \(U\).

**Definition 8.** Let \(\tilde{R}\) be an SVNR from \(U\) to \(V\). If \(\forall x \in U, y \in V, T^\tilde{R}(x, y) = T^\tilde{R}(y, x), I^\tilde{R}(x, y) = I^\tilde{R}(y, x)\) and \(F^\tilde{R}(x, y) = F^\tilde{R}(y, x)\), then \(\tilde{R}\) is called a symmetric SVNR. If \(\forall x \in U, \forall y \in V, T^\tilde{R}(x, y) = 1\) and \(\forall y \in V, I^\tilde{R}(x, y) = 0\), then \(\tilde{R}\) is called a serial SVNR.

The union, intersection and containment of two SVNRs from \(U\) to \(V\) are defined as follows, respectively.

**Definition 9.** Let \(R, S\) be two SVNRs from \(U\) to \(V\).

1. The union \(R \cup S\) of \(R\) and \(S\) is defined by \(R \cup S = \{(x, y), \max\{T^R(x, y), T^S(x, y)\}, \min\{I^R(x, y), I^S(x, y)\}, \min\{F^R(x, y), F^S(x, y)\}) | (x, y) \in U \times V\}\).

2. The intersection \(R \cap S\) of \(R\) and \(S\) is defined by \(R \cap S = \{(x, y), \min\{T^R(x, y), T^S(x, y)\}, \max\{I^R(x, y), I^S(x, y)\}, \max\{F^R(x, y), F^S(x, y)\}) | (x, y) \in U \times V\}\).

3. If \(\forall (x, y) \in U \times V, T^R(x, y) \leq T^S(x, y), I^R(x, y) \geq I^S(x, y)\) and \(F^R(x, y) \geq F^S(x, y)\), then we say \(R\) is contained in \(S\), denoted by \(R \subseteq S\).

Next, we give the notion of \((\alpha, \beta, \gamma)\)-cut relation \(\tilde{R}_{(\alpha, \beta, \gamma)}\) of a single-valued neutrosophic relation \(\tilde{R}\) from \(U\) to \(V\).

**Definition 10.** Let \(U, V\) be two nonempty finite universes and \(\tilde{R}\) be a single-valued neutrosophic relation from \(U\) to \(V\). For any \(\alpha, \beta, \gamma \in (0, 1)\), we define the \((\alpha, \beta, \gamma)\)-cut relation \(\tilde{R}_{(\alpha, \beta, \gamma)}\) of \(\tilde{R}\) as follows:

\[
\tilde{R}_{(\alpha, \beta, \gamma)} = \{(x, y) \in U \times V | T^\tilde{R}(x, y) \geq \alpha, I^\tilde{R}(x, y) \leq \beta, F^\tilde{R}(x, y) \leq \gamma\}.
\]

According to Definition 10, if \((x, y) \in \tilde{R}_{(\alpha, \beta, \gamma)}\), it indicates that the truth membership degree of the relationships of \(x\) and \(y\) w.r.t. SVNR \(\tilde{R}\) is not less than \(\alpha\), and the indeterminacy membership degree and falsity membership degree of the relationships of \(x\) and \(y\) w.r.t. SVNR \(\tilde{R}\) are not more than \(\beta\) and \(\gamma\), respectively.
Definition 11. Let \((U, V, \tilde{R})\) be a generalized single-valued neutrosophic approximation space. \(\tilde{R}_{\{(a, \beta, \gamma)\}}\) is the \((a, \beta, \gamma)\)-cut relation defined in Definition 8. For any \(x \in U, y \in V\), we define
\[
\tilde{R}_{\{(a, \beta, \gamma)\}}(x) = \{y \in V | T_{\tilde{R}}(x, y) \geq a, I_{\tilde{R}}(x, y) \leq \beta, F_{\tilde{R}}(x, y) \leq \gamma\},
\]
\[
\tilde{R}^{-1}_{\{(a, \beta, \gamma)\}}(y) = \{x \in U | T_{\tilde{R}}(x, y) \geq a, I_{\tilde{R}}(x, y) \leq \beta, F_{\tilde{R}}(x, y) \leq \gamma\}.
\]

The following Definition 12 gives a rough set model on two universes based on the \((a, \beta, \gamma)\)-cut relation \(\tilde{R}_{\{(a, \beta, \gamma)\}}\) induced by a single-valued neutrosophic relation \(\tilde{R}\) from \(U\) to \(V\).

Definition 12. Let \((U, V, \tilde{R})\) be a generalized single-valued neutrosophic approximation space. Suppose \(\tilde{R}_{\{(a, \beta, \gamma)\}}\) is the \((a, \beta, \gamma)\)-cut relation given in Definition 10 from \(U\) to \(V\). For any set \(Y \subseteq V\), the lower approximation and upper approximation of \(Y\) on two universes w.r.t. \((U, V, \tilde{R})\) and \((a, \beta, \gamma)\) are defined by
\[
\tilde{R}_{\{(a, \beta, \gamma)\}}(Y) = \{x \in U | \tilde{R}_{\{(a, \beta, \gamma)\}}(x) \subseteq Y\} \text{ and } \tilde{R}_{\{(a, \beta, \gamma)\}}(Y) = \{x \in U | \tilde{R}_{\{(a, \beta, \gamma)\}}(x) \cap Y \neq \emptyset\text{ or } \tilde{R}_{\{(a, \beta, \gamma)\}}(x) = \emptyset\}.
\]

The pair \(\tilde{R}_{\{(a, \beta, \gamma)\}}(Y), \tilde{R}_{\{(a, \beta, \gamma)\}}(Y)\) is called the rough set of \(Y\) w.r.t. \((U, V, \tilde{R})\) and \((a, \beta, \gamma)\). If \(\tilde{R}_{\{(a, \beta, \gamma)\}}(Y) = \tilde{R}_{\{(a, \beta, \gamma)\}}(Y)\), then \(Y\) is called the definable set w.r.t. \((U, V, \tilde{R})\) and \((a, \beta, \gamma)\). If \(\tilde{R}_{\{(a, \beta, \gamma)\}}(Y) \neq \tilde{R}_{\{(a, \beta, \gamma)\}}(Y)\), then \(Y\) is called the undefinable set w.r.t. \((U, V, \tilde{R})\) and \((a, \beta, \gamma)\).

Next, we define the positive region \(\text{pos}_{\tilde{R}_{\{(a, \beta, \gamma)\}}}(Y)\), negative region \(\text{neg}_{\tilde{R}_{\{(a, \beta, \gamma)\}}}(Y)\) and boundary region \(\text{bn}_{\tilde{R}_{\{(a, \beta, \gamma)\}}}(Y)\) of \(Y\), respectively:
\[
\text{pos}_{\tilde{R}_{\{(a, \beta, \gamma)\}}}(Y) = \tilde{R}_{\{(a, \beta, \gamma)\}}(Y),
\]
\[
\text{neg}_{\tilde{R}_{\{(a, \beta, \gamma)\}}}(Y) = U - \tilde{R}_{\{(a, \beta, \gamma)\}}(Y),
\]
\[
\text{bn}_{\tilde{R}_{\{(a, \beta, \gamma)\}}}(Y) = \tilde{R}_{\{(a, \beta, \gamma)\}}(Y) - \tilde{R}_{\{(a, \beta, \gamma)\}}(Y).
\]

Remark 2. If \(\tilde{R}\) is a series single-valued neutrosophic relation from \(U\) to \(V\), i.e., \(\forall x \in U, \forall y \in U \bigwedge_{y \in U} T_{\tilde{R}}(x, y) = 1\) and \(\bigwedge_{y \in U} I_{\tilde{R}}(x, y) = \bigwedge_{y \in U} F_{\tilde{R}}(x, y) = 0\), then there exists \(y \in V\) such that \(T_{\tilde{R}}(x, y) = 1\) and \(I_{\tilde{R}}(x, y) = 0, F_{\tilde{R}}(x, y) = 0\) for all \(x \in U\) since \(V\) is finite. Therefore, for any \(a, \beta, \gamma \in (0, 1]\), we have \(\tilde{R}_{\{(a, \beta, \gamma)\}}(x) \neq \emptyset\). Therefore, we have
\[
\tilde{R}_{\{(a, \beta, \gamma)\}}(Y) = \{x \in U | \tilde{R}_{\{(a, \beta, \gamma)\}}(x) \subseteq Y\} \text{ and } \tilde{R}_{\{(a, \beta, \gamma)\}}(Y) = \{x \in U | \tilde{R}_{\{(a, \beta, \gamma)\}}(x) \cap Y \neq \emptyset\text{ or } \tilde{R}_{\{(a, \beta, \gamma)\}}(x) = \emptyset\}.
\]

In the following, we discuss some properties of the lower approximation and the upper approximation given in Definition 12.

Theorem 1. Let \((U, V, \tilde{R})\) be a generalized single-valued neutrosophic approximation space. Suppose \(\tilde{R}_{\{(a, \beta, \gamma)\}}\) is the \((a, \beta, \gamma)\)-cut relation given in Definition 10 from \(U\) to \(V\). For any \(Y, Y_1, Y_2 \subseteq V\), the following properties hold:

1. \(\tilde{R}_{\{(a, \beta, \gamma)\}}(Y) \subseteq \tilde{R}_{\{(a, \beta, \gamma)\}}(Y)\);
2. \(\tilde{R}_{\{(a, \beta, \gamma)\}}(\emptyset) = \emptyset, \tilde{R}_{\{(a, \beta, \gamma)\}}(V) = U\);
3. \(\tilde{R}_{\{(a, \beta, \gamma)\}}(Y_1 \cap Y_2) = \tilde{R}_{\{(a, \beta, \gamma)\}}(Y_1) \cap \tilde{R}_{\{(a, \beta, \gamma)\}}(Y_2)\),
\(\tilde{R}_{\{a, b, \gamma\}}(Y_1 \cup Y_2) = \tilde{R}_{\{a, b, \gamma\}}(Y_1) \cup \tilde{R}_{\{a, b, \gamma\}}(Y_2);\)

(4) \(\tilde{R}_{\{a, b, \gamma\}}(Y_1 \cup Y_2) \supseteq \tilde{R}_{\{a, b, \gamma\}}(Y_1) \cup \tilde{R}_{\{a, b, \gamma\}}(Y_2),\)

\(\tilde{R}_{\{a, b, \gamma\}}(Y_1 \cap Y_2) \subseteq \tilde{R}_{\{a, b, \gamma\}}(Y_1) \cap \tilde{R}_{\{a, b, \gamma\}}(Y_2);\)

(5) If \(Y_1 \subseteq Y_2,\) then \(\tilde{R}_{\{a, b, \gamma\}}(Y_1) \subseteq \tilde{R}_{\{a, b, \gamma\}}(Y_2)\) and \(\tilde{R}_{\{a, b, \gamma\}}(Y_1) \subseteq \tilde{R}_{\{a, b, \gamma\}}(Y_2);\)

(6) \(\tilde{R}_{\{a, b, \gamma\}}(Y) = \sim \tilde{R}_{\{a, b, \gamma\}}(\sim Y), \tilde{R}_{\{a, b, \gamma\}}(Y) = \sim \tilde{R}_{\{a, b, \gamma\}}(\sim Y).\)

**Proof.** We only prove (3) and (6).

(3) \(\tilde{R}_{\{a, b, \gamma\}}(Y_1 \cap Y_2)\)

- \(\{x \in U | \tilde{R}_{\{a, b, \gamma\}}(x) \subseteq Y_1 \cap Y_2 \land \tilde{R}_{\{a, b, \gamma\}}(x) \neq \emptyset\}\)
- \(\{x \in U | \tilde{R}_{\{a, b, \gamma\}}(x) \subseteq Y_1 \cap Y_2 \land \tilde{R}_{\{a, b, \gamma\}}(x) \neq \emptyset\}\)
- \(\{x \in U | \tilde{R}_{\{a, b, \gamma\}}(x) \subseteq Y_1 \cap Y_2 \land \tilde{R}_{\{a, b, \gamma\}}(x) \neq \emptyset\}\)

\(\tilde{R}_{\{a, b, \gamma\}}(Y_1 \cap Y_2) = \tilde{R}_{\{a, b, \gamma\}}(Y_1) \cap \tilde{R}_{\{a, b, \gamma\}}(Y_2).\)

(6) \(\sim \tilde{R}_{\{a, b, \gamma\}}(\sim Y)\)

- \(\sim \{x \in U | \tilde{R}_{\{a, b, \gamma\}}(x) \subseteq Y \land \tilde{R}_{\{a, b, \gamma\}}(x) \neq \emptyset\}\)
- \(\sim \{x \in U | \tilde{R}_{\{a, b, \gamma\}}(x) \subseteq Y \land \tilde{R}_{\{a, b, \gamma\}}(x) \neq \emptyset\}\)
- \(\sim \{x \in U | \tilde{R}_{\{a, b, \gamma\}}(x) \subseteq Y \land \tilde{R}_{\{a, b, \gamma\}}(x) \neq \emptyset\}\)

\(\sim \tilde{R}_{\{a, b, \gamma\}}(Y).\)

**Remark 3.** In general,

(1) \(\tilde{R}_{\{a, b, \gamma\}}(\emptyset) \neq \emptyset, \tilde{R}_{\{a, b, \gamma\}}(V) \neq U;\)

(2) \(\tilde{R}_{\{a, b, \gamma\}}(Y_1 \cup Y_2) \neq \tilde{R}_{\{a, b, \gamma\}}(Y_1) \cup \tilde{R}_{\{a, b, \gamma\}}(Y_2)\) and \(\tilde{R}_{\{a, b, \gamma\}}(Y_1 \cap Y_2) \neq \tilde{R}_{\{a, b, \gamma\}}(Y_1) \cap \tilde{R}_{\{a, b, \gamma\}}(Y_2).\)

as shown in the following example.

**Example 1.** Let \(U = \{x_1, x_2, x_3\}, V = \{y_1, y_2, y_3, y_4\}.\) \(Y_1 = \{y_1\}\) and \(Y_2 = \{y_3\}.\) The single-valued neutrosophic relation \(\tilde{R}\) from \(U\) to \(V\) is given in Table 1.
Table 1. The single-valued neutrosophic relation $\bar{R}$ from $U$ to $V$.

(1) Take $\alpha = 0.9$, $\beta = 0.3$ and $\gamma = 0.2$; we have

$\bar{R}_{\alpha}(0.9,0.3,0.2)(x_1) = \{y_4\}$, $\bar{R}_{\alpha}(0.9,0.3,0.2)(x_2) = \{y_1\}$, $\bar{R}_{\alpha}(0.9,0.3,0.2)(x_3) = \{y_3\}$.

By Definition 12, we have $\bar{R}_{\alpha}(0.9,0.3,0.2)(\emptyset) \neq \emptyset$ and $\bar{R}_{\alpha}(0.9,0.3,0.2)(V) = \{x_1, x_2\} \neq U$.

(2) Take $\alpha = 0.5$, $\beta = 0.3$ and $\gamma = 0.2$; we have

$\bar{R}_{\alpha}(0.5,0.3,0.2)(x_1) = \{y_1, y_2, y_3, y_4\}$, $\bar{R}_{\alpha}(0.5,0.3,0.2)(x_2) = \{y_1, y_3\}$, $\bar{R}_{\alpha}(0.5,0.3,0.2)(x_3) = \emptyset$.

By Definition 12, we have

$\bar{R}_{\alpha}(0.5,0.3,0.2)(Y_1) = \{x_1, x_2\}$, $\bar{R}_{\alpha}(0.5,0.3,0.2)(Y_2) = \{x_1, x_2, x_3\}$, $\bar{R}_{\alpha}(0.5,0.3,0.2)(Y_1 \cap Y_2) = \emptyset$.

Obviously, $\bar{R}_{\alpha}(0.5,0.3,0.2)(Y_1 \cup Y_2) \neq \bar{R}_{\alpha}(0.5,0.3,0.2)(Y_1) \cup \bar{R}_{\alpha}(0.5,0.3,0.2)(Y_2)$.

Theorem 2. Let $(U, V, \bar{R})$ be a generalized single-valued neutrosophic approximation space. $\bar{R}_{\alpha, \beta, \gamma}$ and $\bar{R}_{\alpha, \beta, \gamma}$ are two relations defined in Definition 10. If $\bar{R}$ is a series, $\alpha_1 \leq \alpha_2$, $\beta_1 \geq \beta_2$ and $\gamma_1 \geq \gamma_2$, then

1. $\bar{R}_{\alpha, \beta, \gamma}(Y) \subseteq \bar{R}_{\alpha, \beta, \gamma}(Y)$;
2. $\bar{R}_{\alpha, \beta, \gamma}(Y) \subseteq \bar{R}_{\alpha, \beta, \gamma}(Y)$.

Proof. (1) Since $\alpha_1 \leq \alpha_2$, $\beta_1 \geq \beta_2$ and $\gamma_1 \geq \gamma_2$, for any $x \in U$, we have

$\bar{R}_{\alpha, \beta}(x) = \{y \in V | I_{\bar{R}}(x, y) \geq \alpha, I_{\bar{R}}(x, y) \leq \beta, F_{\bar{R}}(x, y) \leq \gamma\}$

By Definition 12, for any $x \in \bar{R}_{\alpha, \beta}(Y)$, we have $\bar{R}_{\alpha, \beta}(x) \subseteq Y$.

Thus $\bar{R}_{\alpha, \beta}(x) \subseteq \bar{R}_{\alpha, \beta}(Y)$, which implies that $x \in \bar{R}_{\alpha, \beta}(Y)$.

Hence, $\bar{R}_{\alpha, \beta}(Y) \subseteq \bar{R}_{\alpha, \beta}(Y)$.

(2) By (1), for any $x \in U$, we have $\bar{R}_{\alpha, \beta}(x) \supseteq \bar{R}_{\alpha, \beta}(Y)$.

So

$\bar{R}_{\alpha, \beta}(x) \cap Y \supseteq \bar{R}_{\alpha, \beta}(Y)$ for any $x \in U$.

By Definition 12, for any $x \in \bar{R}_{\alpha, \beta}(Y)$, we have $\bar{R}_{\alpha, \beta}(x) \cap Y \neq \emptyset$.

Thus, $\bar{R}_{\alpha, \beta}(x) \cap Y \neq \emptyset$, which implies that $x \in \bar{R}_{\alpha, \beta}(Y)$.

Hence, $\bar{R}_{\alpha, \beta}(Y) \subseteq \bar{R}_{\alpha, \beta}(Y)$.

Theorem 3. Let $\bar{R}, \bar{S}$ be two series single-valued neutrosophic relations from $U$ to $V$. If $\bar{R} \subseteq \bar{S}$, then $\forall Y \subseteq V$, we have:

1. $\bar{S}_{\alpha, \beta}(Y) \subseteq \bar{R}_{\alpha, \beta}(Y)$.
Theorem 4. Let \( \tilde{R}, \tilde{S} \) be two single-valued neutrosophic relations from \( U \) to \( V \). For any \( Y \subseteq V \) and \( \alpha, \beta, \gamma \in [0, 1] \), we have:

1. \( \tilde{R} \cup \tilde{S} \)(\( \alpha, \beta, \gamma \)) \( (Y) \subseteq \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \cup \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \cup \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)).

2. \( \tilde{R} \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \subseteq \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)).

Proof. (1) By Lemma 1 (1), we have

\( \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \subseteq \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \cup \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \cup \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)).

\( \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \subseteq \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \cup \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( Y \)) \( \cup \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( Y \)).

Lemma 1. Let \( \tilde{R}, \tilde{S} \) be two single-valued neutrosophic relations from \( U \) to \( V \). For any \( x \in U \) and \( \alpha, \beta, \gamma \in [0, 1] \), we have:

1. \( \tilde{R} \cup \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( x \)) \( \supseteq \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( x \)) \cup \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( x \)).

2. \( \tilde{R} \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( x \)) \( = \) \( \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( x \)) \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( x \)).

Proof. (1) For any \( x \in U \), we have:

\( \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( x \)) = \{ y \in V \mid \max(T\( \tilde{R} \)(\( x, y \)), T\( \tilde{S} \)(\( x, y \))) \geq \min(I\( \tilde{R} \)(\( x, y \)), I\( \tilde{S} \)(\( x, y \))) \leq \beta, \min(F\( \tilde{R} \)(\( x, y \)), F\( \tilde{S} \)(\( x, y \))) \leq \gamma \}

\( \cap \{ y \in V \mid T\( \tilde{R} \)(\( x, y \)) \geq \alpha, I\( \tilde{R} \)(\( x, y \)) \leq \beta, F\( \tilde{R} \)(\( x, y \)) \leq \gamma \}

\( \cup \{ y \in V \mid T\( \tilde{S} \)(\( x, y \)) \geq \alpha, I\( \tilde{S} \)(\( x, y \)) \leq \beta, F\( \tilde{S} \)(\( x, y \)) \leq \gamma \}

\( = \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( x \)) \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( x \)).

(2) For any \( x \in U \), we have:

\( \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( x \)) = \{ y \in V \mid \min(T\( \tilde{R} \)(\( x, y \)), T\( \tilde{S} \)(\( x, y \))) \geq \alpha, \max(I\( \tilde{R} \)(\( x, y \)), I\( \tilde{S} \)(\( x, y \))) \leq \beta, \max(F\( \tilde{R} \)(\( x, y \)), F\( \tilde{S} \)(\( x, y \))) \leq \gamma \}

\( = \{ y \in V \mid T\( \tilde{R} \)(\( x, y \)) \geq \alpha, I\( \tilde{S} \)(\( x, y \)) \leq \beta, F\( \tilde{S} \)(\( x, y \)) \leq \gamma \}

\( = \tilde{R} \)(\( \alpha, \beta, \gamma \))(\( x \)) \cap \tilde{S} \)(\( \alpha, \beta, \gamma \))(\( x \)).

\( \square \)
[(2)] \[ (\tilde{R} \cup \tilde{S})_{\{\alpha, \beta, \gamma\}}(Y) \subseteq \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cap \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y) \subseteq \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cup \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y). \]

By Lemma 1 (1), we have
\[ (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(Y) = \{ x \in U | (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(x) \cap Y \neq \emptyset \} \]
\[ \supseteq \{ x \in U | (\tilde{R}_{\{\alpha, \beta, \gamma\}}(x) \cup \tilde{S}_{\{\alpha, \beta, \gamma\}}(x)) \cap Y \neq \emptyset \} \]
\[ = \{ x \in U | (\tilde{R}_{\{\alpha, \beta, \gamma\}}(x) \cap Y \neq \emptyset) \cup \{ x \in U | \tilde{S}_{\{\alpha, \beta, \gamma\}}(x) \cap Y \neq \emptyset \} \]
\[ = \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cup \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y). \]

\[ \Box \]

**Theorem 5.** Let \( \tilde{R}, \tilde{S} \) be two series single-valued neutrosophic relations from \( U \) to \( V \). For any \( Y \subseteq V \) and \( \alpha, \beta, \gamma \in [0, 1] \), we have:

1. \[ (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(Y) \supseteq \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cup \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y) \supseteq \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cap \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y); \]
2. \[ (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(Y) \subseteq \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cap \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y). \]

**Proof.** (1) By Lemma 1 (2), we have
\[ (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(Y) = \{ x \in U | (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(x) \subseteq Y \} \]
\[ = \{ x \in U | (\tilde{R}_{\{\alpha, \beta, \gamma\}}(x) \cap \tilde{S}_{\{\alpha, \beta, \gamma\}}(x)) \subseteq Y \} \]
\[ \supseteq \{ x \in U | (\tilde{R}_{\{\alpha, \beta, \gamma\}}(x) \subseteq Y) \cup \{ x \in U | \tilde{S}_{\{\alpha, \beta, \gamma\}}(x) \subseteq Y \} \]
\[ = \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cup \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y). \]

Therefore,
\[ (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(Y) \supseteq \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cup \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y) \supseteq \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cap \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y). \]

(2) By Lemma 1 (2), we have
\[ (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(Y) = \{ x \in U | (\tilde{R} \cap \tilde{S})_{\{\alpha, \beta, \gamma\}}(x) \cap Y \neq \emptyset \} \]
\[ = \{ x \in U | (\tilde{R}_{\{\alpha, \beta, \gamma\}}(x) \cap \tilde{S}_{\{\alpha, \beta, \gamma\}}(x)) \cap Y \neq \emptyset \} \]
\[ \subseteq \{ x \in U | \tilde{R}_{\{\alpha, \beta, \gamma\}}(x) \cap Y \neq \emptyset \} \cap \{ x \in U | \tilde{S}_{\{\alpha, \beta, \gamma\}}(x) \cap Y \neq \emptyset \} \]
\[ = \tilde{R}_{\{\alpha, \beta, \gamma\}}(Y) \cap \tilde{S}_{\{\alpha, \beta, \gamma\}}(Y). \]

\[ \Box \]

Next, we define the inverse lower approximation and upper approximation on two universes w.r.t. \( (U, V, \tilde{R}) \) and \( (\alpha, \beta, \gamma) \) as follows:

**Definition 13.** Let \( (U, V, \tilde{R}) \) be a generalized single-valued neutrosophic approximation space. For any \( \alpha, \beta, \gamma \in [0, 1], X \subseteq U \), the inverse lower approximation and upper approximation of \( X \) on two universes w.r.t. \( (U, V, \tilde{R}) \) and \( (\alpha, \beta, \gamma) \) are defined as:

\[ \tilde{R}^{-1}_{\{\alpha, \beta, \gamma\}}(X) = \{ y \in V | \tilde{R}^{-1}_{\{\alpha, \beta, \gamma\}}(y) \subseteq X \ and \ \tilde{R}^{-1}_{\{\alpha, \beta, \gamma\}}(y) \neq \emptyset \}, \]
\[ \tilde{R}^{-1}_{\{\alpha, \beta, \gamma\}}(X) = \{ y \in V | \tilde{R}^{-1}_{\{\alpha, \beta, \gamma\}}(y) \cap X \neq \emptyset \ or \ \tilde{R}^{-1}_{\{\alpha, \beta, \gamma\}}(y) = \emptyset \}. \]
The pair \((\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X), \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X))\) is called the inverse rough set of \(X\) w.r.t. \((U, V, \hat{R})\) and \((a, \beta, \gamma)\).

**Theorem 6.** Let \((U, V, \hat{R})\) be a generalized single-valued neutrosophic approximation space. \(\hat{R}_{\{(a,\beta,\gamma)\}}\) is the \((a, \beta, \gamma)\)-cut relation given in Definition 10 from \(U\) to \(V\), where \(a, \beta, \gamma \in (0, 1]\). For any \(X, X_1, X_2 \subseteq U\), we have:

1. \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X) \subseteq \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X)\);
2. \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}( \emptyset ) = \emptyset\); \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(U) = V\);
3. \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_1 \cap X_2) = \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_1) \cap \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_2)\);
4. \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_1 \cup X_2) = \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_1) \cup \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_2)\);
5. If \(X_1 \subseteq X_2\), then \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_1) \subseteq \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_2)\) and \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_1) \subseteq \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X_2)\);
6. \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X) = \sim \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(\sim X)\), \(\hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(X) = \sim \hat{R}_{\{(a,\beta,\gamma)\}}^{-1}(\sim X)\).

**Proof.** The proof is similar to that of Theorem 1. \(\Box\)

**Definition 14.** Let \((U, V, \hat{R})\) be a generalized single-valued neutrosophic approximation space. \(\hat{R}_{\{(a,\beta,\gamma)\}}\) is a \((a, \beta, \gamma)\)-cut relation defined in Definition 10. For any \(Y \subseteq V\), the approximate precision \(\rho_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y)\) of \(Y\) w.r.t. \(\hat{R}_{\{(a,\beta,\gamma)\}}\) is defined as follows:

\[
\rho_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y) = \frac{|\hat{R}_{\{(a,\beta,\gamma)\}}(Y)|}{|\hat{R}_{\{(a,\beta,\gamma)\}}(Y)|},
\]

where \(|Y|\) represents the cardinality of the set \(Y\).

Let \(\mu_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y) = 1 - \rho_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y)\), and \(\mu_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y)\) is called the rough degree of with regard to \(\hat{R}_{\{(a,\beta,\gamma)\}}\). It is obviously that \(0 \leq \rho_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y) \leq 1\) and \(0 \leq \mu_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y) \leq 1\).

The following Theorem 7 discusses the properties of approximation precision and rough degree.

**Theorem 7.** Let \((U, V, \hat{R})\) be a generalized single-valued neutrosophic approximation space. \(\hat{R}_{\{(a,\beta,\gamma)\}}\) is a \((a, \beta, \gamma)\)-cut relation defined in Definition 10. For any \(Y_1, Y_2 \subseteq V\), then the rough degree and the approximate precision of the set \(Y_1, Y_2, Y_1 \cup Y_2, Y_1 \cap Y_2\) satisfy the following properties:

1. \(\mu_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y_1 \cup Y_2) = \hat{R}_{\{(a,\beta,\gamma)\}}(Y_1) \cup \hat{R}_{\{(a,\beta,\gamma)\}}(Y_2)\) \quad \mu_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y_1 \cap Y_2) = \hat{R}_{\{(a,\beta,\gamma)\}}(Y_1) \cap \hat{R}_{\{(a,\beta,\gamma)\}}(Y_2)\);
2. \(\rho_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y_1 \cup Y_2) = \hat{R}_{\{(a,\beta,\gamma)\}}(Y_1) \cup \hat{R}_{\{(a,\beta,\gamma)\}}(Y_2)\) \quad \rho_{\hat{R}_{\{(a,\beta,\gamma)\}}}(Y_1 \cap Y_2) = \hat{R}_{\{(a,\beta,\gamma)\}}(Y_1) \cap \hat{R}_{\{(a,\beta,\gamma)\}}(Y_2)\).

**Proof.** According to the definition of the rough degree, we have
\[\mu_{\tilde{R}_{\{1,\alpha,\gamma\}}} (Y_1 \cup Y_2) = 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1 \cup Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|} \]
\[= 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|} \]
\[\leq 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}. \]

Then, we have
\[\mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_1 \cup Y_2) \leq |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| - |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|. \]

Similarly, we have
\[\mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_1 \cap Y_2) = 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1 \cap Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|} \]
\[= 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|} \]
\[\leq 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}. \]

Hence,
\[\mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_1 \cap Y_2) \leq |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}. \]

Furthermore, we know \(|A \cup B| = |A| + |B| - |A \cap B|\) holds for any sets \(A\) and \(B\). Then,
\[\mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_1 \cup Y_2) \leq |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| \]
\[\leq |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| + |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| \]
\[= |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1)| + |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| - |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| \]
\[\leq \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cup \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|} \]
\[\leq \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1) \cap \tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}. \]

Furthermore, by
\[\mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_1) = 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1)|} \text{ and } \mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_2) = 1 - \frac{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}{|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)|}, \text{ we have} \]
\[|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1)| = |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_1)| = \mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_1) \text{ and } \]
\[|\tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| = |\tilde{R}_{\{1,\alpha,\gamma\}}(Y_2)| = \mu_{\tilde{R}_{\{1,\alpha,\gamma\}}}(Y_2). \]
Therefore,
\[
\mu_{\tilde{R}_{\{\alpha,\beta,\gamma\}}} (Y_1 \cup Y_2) |\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_1) \cap \tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_2)| \\
\leq |\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_1)| + |\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_2)| - |\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_1)| - |\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_2)| \\
- \mu_{\tilde{R}_{\{\alpha,\beta,\gamma\}}} (Y_1 \cap Y_2) |\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_1) \cap \tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_2)| \\
= \mu_{\tilde{R}_{\{\alpha,\beta,\gamma\}}} (Y_1)|\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_1)| + \mu_{\tilde{R}_{\{\alpha,\beta,\gamma\}}} (Y_2)|\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_2)| \\
- \mu_{\tilde{R}_{\{\alpha,\beta,\gamma\}}} (Y_1 \cap Y_2) |\tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_1) \cap \tilde{R}_{\{\alpha,\beta,\gamma\}}(Y_2)|.
\]

\[
\Box
\]

4. Two Extended Models

In this section, we give two extended rough set models of the model in Section 3, i.e., the degree rough set model and the variable precision rough set model.

4.1. The Degree Rough Set Model on Two Different Universes

**Definition 15.** Let \((U, V, \tilde{R})\) be a generalized single-valued neutrosophic approximation space and \(\tilde{R}_{\{\alpha,\beta,\gamma\}}\) be a \((\alpha, \beta, \gamma)\)-cut relation defined in Definition 10. For any \(Y \subseteq V\), we define the degree lower and upper approximations of \(Y\) w.r.t. the degree \(k\), \((U, V, \tilde{R})\) and \((\alpha, \beta, \gamma)\) as follows:

\[
\tilde{R}_{\{\alpha,\beta,\gamma\}}^\downarrow(Y) = \{ x \in U | |\tilde{R}_{\{\alpha,\beta,\gamma\}}(x) - Y| \leq k \text{ and } \tilde{R}_{\{\alpha,\beta,\gamma\}}(x) \neq \emptyset \}, \\
\tilde{R}_{\{\alpha,\beta,\gamma\}}^\uparrow(Y) = \{ x \in U | |\tilde{R}_{\{\alpha,\beta,\gamma\}}(x) \cap Y| \leq k \text{ and } \tilde{R}_{\{\alpha,\beta,\gamma\}}(x) \neq \emptyset \}; \\
\tilde{R}_{\{\alpha,\beta,\gamma\}}^k(Y) = \{ x \in U | |\tilde{R}_{\{\alpha,\beta,\gamma\}}(x) \cap Y| > k \text{ or } \tilde{R}_{\{\alpha,\beta,\gamma\}}(x) = \emptyset \}.
\]

where \(k\) is a finite nonnegative integer and \(|Y|\) denotes the cardinality of the set \(Y\).

The pair \((\tilde{R}_{\{\alpha,\beta,\gamma\}}^k(Y), \tilde{R}_{\{\alpha,\beta,\gamma\}}^\downarrow(Y))\) is called the degree rough set of \(Y\) w.r.t. the degree \(k\), \((U, V, \tilde{R})\) and \((\alpha, \beta, \gamma)\).

We also define the positive region \(\text{pos}_{\tilde{R}_{\{\alpha,\beta,\gamma\}}}^k(Y)\), negative region \(\text{neg}_{\tilde{R}_{\{\alpha,\beta,\gamma\}}}^k(Y)\) and boundary region \(\text{bn}_{\tilde{R}_{\{\alpha,\beta,\gamma\}}}^k(Y)\) of \(Y\) as follows:

\[
\text{pos}_{\tilde{R}_{\{\alpha,\beta,\gamma\}}}^k(Y) = \tilde{R}_{\{\alpha,\beta,\gamma\}}^k(Y), \\
\text{neg}_{\tilde{R}_{\{\alpha,\beta,\gamma\}}}^k(Y) = U - \tilde{R}_{\{\alpha,\beta,\gamma\}}^k(Y), \\
\text{bn}_{\tilde{R}_{\{\alpha,\beta,\gamma\}}}^k(Y) = \tilde{R}_{\{\alpha,\beta,\gamma\}}^k(Y) - \tilde{R}_{\{\alpha,\beta,\gamma\}}^k(Y).
\]

**Remark 4.** In Definition 15, if \(k = 0\), then

\[
\tilde{R}_{\{\alpha,\beta,\gamma\}}^0(Y) = \{ x \in U | |\tilde{R}_{\{\alpha,\beta,\gamma\}}(x) \cap Y| = 0 \text{ or } \tilde{R}_{\{\alpha,\beta,\gamma\}}(x) = \emptyset \}, \\
\tilde{R}_{\{\alpha,\beta,\gamma\}}^0(Y) = \{ x \in U | |\tilde{R}_{\{\alpha,\beta,\gamma\}}(x) \cap Y| > 0 \text{ or } \tilde{R}_{\{\alpha,\beta,\gamma\}}(x) = \emptyset \}.
\]

which implies that the lower and upper approximation operators in Definition 12 are special cases of the degree lower and upper approximation operators in Definition 15, respectively.
In following Theorem 8, we discuss some properties of the degree lower and upper approximation operators.

**Theorem 8.** Let \((U, V, \tilde{R})\) be a generalized single-valued neutrosophic approximation space, and \(\tilde{R}_{((a, \beta, \gamma))}\) is the \((a, \beta, \gamma)\)-cut relation defined in Definition 10. For any \(Y \subseteq V\), we have:

1. \(\tilde{R}_{((a, \beta, \gamma))} (Y_1 \cap Y_2) = \tilde{R}_{((a, \beta, \gamma))} (Y_1) \cap \tilde{R}_{((a, \beta, \gamma))} (Y_2)\),
2. \(\tilde{R}_{((a, \beta, \gamma))} (Y_1 \cup Y_2) = \tilde{R}_{((a, \beta, \gamma))} (Y_1) \cup \tilde{R}_{((a, \beta, \gamma))} (Y_2)\),
3. \(\tilde{R}_{((a, \beta, \gamma))} (Y_1 \cup A_2) \supseteq \tilde{R}_{((a, \beta, \gamma))} (Y_1) \cup \tilde{R}_{((a, \beta, \gamma))} (Y_2)\),
4. \(\tilde{R}_{((a, \beta, \gamma))} (Y) \sim \tilde{R}_{((a, \beta, \gamma))} (\sim Y)\),
5. \(\tilde{R}_{((a, \beta, \gamma))} (Y_1) \subseteq \tilde{R}_{((a, \beta, \gamma))} (Y_2)\) and \(\tilde{R}_{((a, \beta, \gamma))} (Y_1) \subseteq \tilde{R}_{((a, \beta, \gamma))} (Y_2)\),
6. \(k \geq 1\), then \(\tilde{R}_{((a, \beta, \gamma))} (Y) \subseteq \tilde{R}_{((a, \beta, \gamma))} (Y) \subseteq \tilde{R}_{((a, \beta, \gamma))} (Y)\), where \(k\) is a finite positive integer.

**Proof.** We only prove (4) and (6).

4. Notice that \(Y_1 \cap Y_2 = Y_1 \cap (\sim Y_2)\) and \((\sim Y) = Y\) for any set \(Y \subseteq V\); we have
   \[
   \sim \tilde{R}_{((a, \beta, \gamma))} (Y) = \sim \{x \in U|\tilde{R}_{((a, \beta, \gamma))} (x) \cap \sim Y > k \text{ or } \tilde{R}_{((a, \beta, \gamma))} (x) = \emptyset\} = \{x \in U|\tilde{R}_{((a, \beta, \gamma))} (x) \cap \sim Y < k \text{ and } \tilde{R}_{((a, \beta, \gamma))} (x) \neq \emptyset\} = \tilde{R}_{((a, \beta, \gamma))} (Y),
   \]
   \[
   \sim \tilde{R}_{((a, \beta, \gamma))} (Y) = \sim \{x \in U|\tilde{R}_{((a, \beta, \gamma))} (x) \cap \sim Y \leq k \text{ and } \tilde{R}_{((a, \beta, \gamma))} (x) \neq \emptyset\} = \{x \in U|\tilde{R}_{((a, \beta, \gamma))} (x) \cap \sim Y > k \text{ or } \tilde{R}_{((a, \beta, \gamma))} (x) = \emptyset\} = \tilde{R}_{((a, \beta, \gamma))} (Y).
   \]

6. Since \(k \geq 1\), for any \(x \in U\) and \(Y \subseteq V\), we have
   \[
   \bar{R}_{((a, \beta, \gamma))} (Y) = \{x \in U|\bar{R}_{((a, \beta, \gamma))} (x) - Y \leq l \text{ and } \tilde{R}_{((a, \beta, \gamma))} (x) \neq \emptyset\} \subseteq \{x \in U|\bar{R}_{((a, \beta, \gamma))} (x) - Y \leq k \text{ and } \tilde{R}_{((a, \beta, \gamma))} (x) \neq \emptyset\} = \tilde{R}_{((a, \beta, \gamma))} (Y).
   \]
   For any \(x \in \tilde{R}_{((a, \beta, \gamma))} (Y)\), we have \(\bar{R}_{((a, \beta, \gamma))} (x) - Y \leq l \text{ and } \tilde{R}_{((a, \beta, \gamma))} (x) \neq \emptyset\), then we have \(\bar{R}_{((a, \beta, \gamma))} (x) - Y \leq k \text{ and } \tilde{R}_{((a, \beta, \gamma))} (x) \neq \emptyset\), so \(x \in \bar{R}_{((a, \beta, \gamma))} (Y)\). Hence,
   \[
   \bar{R}_{((a, \beta, \gamma))} (Y) \subseteq \bar{R}_{((a, \beta, \gamma))} (Y). \qed
   \]

**Remark 5.** In general, \(\tilde{R}_{((a, \beta, \gamma))} (Y_1 \cap Y_2) \supseteq \tilde{R}_{((a, \beta, \gamma))} (Y_1) \cap \tilde{R}_{((a, \beta, \gamma))} (Y_2)\) does not hold, where \(k\) is a finite positive integer. The reason is that if \(k > 0\), then \(\tilde{R}_{((a, \beta, \gamma))} - Y_1 \leq k \text{ and } \tilde{R}_{((a, \beta, \gamma))} - Y_2 \leq k \Rightarrow \tilde{R}_{((a, \beta, \gamma))} - Y_1 \cap Y_2 \leq k\). Besides, \(\tilde{R}_{((a, \beta, \gamma))} (Y_1 \cup Y_2) \subseteq \tilde{R}_{((a, \beta, \gamma))} (Y_1) \cup \tilde{R}_{((a, \beta, \gamma))} (Y_2)\).
also does not hold in general, where \( k \) is a finite positive integer. The reason is that if \( k > 0 \), then 
\[
|\tilde{R}_{(a,\beta,\gamma)}(x) \cap (Y_1 \cup Y_2)| > k \iff |\tilde{R}_{(a,\beta,\gamma)} \cap Y_1| > k \text{ or } |\tilde{R}_{(a,\beta,\gamma)} \cap Y_2| > k.
\]

4.2. The Variable Precision Rough Set Model on Two Different Universes

**Definition 16.** Let \((U, V, \tilde{R})\) be a generalized single valued neutrosophic approximation space. For any \(Y \subseteq V, \alpha, \beta, \gamma \in (0, 1)\), we define the variable precision lower and upper approximation of \(Y\) w.r.t. the control parameter \(v, (U, V, \tilde{R})\) and \((\alpha, \beta, \gamma)\) as follows, respectively:

\[
\begin{align*}
\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v(Y) &= \{ x \in U | |\tilde{R}_{(a,\beta,\gamma)}(x) \cap Y| \geq 1 - v, \tilde{R}_{(a,\beta,\gamma)}(x) \neq \emptyset \}, \\
\overline{V\tilde{R}}_{(a,\beta,\gamma)}(Y) &= \{ x \in U | |\tilde{R}_{(a,\beta,\gamma)}(x) \cap Y| > v, \tilde{R}_{(a,\beta,\gamma)}(x) \neq \emptyset \} \cup \{ x \in U | \tilde{R}_{(a,\beta,\gamma)}(x) = \emptyset \},
\end{align*}
\]

where \(v \in [0, 0.5]\), \(|Y|\) denotes the cardinality of the set \(Y\).

The pair \( (\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v, \overline{V\tilde{R}}_{(a,\beta,\gamma)}^v) \) is called the variable precision single-valued neutrosophic rough set of \(A\) with respect to the control parameter \(v, (U, V, \tilde{R})\) and \((\alpha, \beta, \gamma)\).

We also define the positive region \(\text{pos}_{\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v}(Y)\), negative region \(\text{neg}_{\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v}(Y)\) and boundary region \(\text{bn}_{\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v}(Y)\) of \(Y\) about \(\overline{R}_{(a,\beta,\gamma)}\) as follows:

\[
\begin{align*}
\text{pos}_{\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v}(Y) &= \overline{V\tilde{R}}_{(a,\beta,\gamma)}^v(Y), \\
\text{neg}_{\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v}(Y) &= U - \overline{V\tilde{R}}_{(a,\beta,\gamma)}^v(Y), \\
\text{bn}_{\overline{V\tilde{R}}_{(a,\beta,\gamma)}^v}(Y) &= \overline{V\tilde{R}}_{(a,\beta,\gamma)}^v(Y) - \overline{V\tilde{R}}_{(a,\beta,\gamma)}^v(Y).
\end{align*}
\]

The following Theorems 9 and 10 can be easily obtained by Definition 16.

**Theorem 9.** Let \((U, V, \tilde{R})\) be a generalized single valued neutrosophic approximation space. For any \(Y \subseteq V, \alpha, \beta, \gamma \in [0, 1], v = [0, 0.5]\), then:

\[
\begin{align*}
(1) & \quad \overline{R}_{(a,\beta,\gamma)}(Y) \subseteq \overline{V\tilde{R}}_{(a,\beta,\gamma)}(Y); \\
(2) & \quad \overline{V\tilde{R}}_{(a,\beta,\gamma)}(Y) \subseteq \overline{R}_{(a,\beta,\gamma)}(Y).
\end{align*}
\]

**Proof.** The proof is straightforward from Definition 16. \(\square\)

**Remark 6.** In Theorem 9, if \(v = 0\), then:

\[
\begin{align*}
(1) & \quad \overline{V\tilde{R}}_{(a,\beta,\gamma)}^0(Y) = \overline{R}_{(a,\beta,\gamma)}(Y); \\
(2) & \quad \overline{R}_{(a,\beta,\gamma)}^0(Y) = \overline{R}_{(a,\beta,\gamma)}(Y).
\end{align*}
\]

**Theorem 10.** Let \((U, V, \tilde{R})\) be a generalized single valued neutrosophic approximation space. For any \(Y \subseteq V, \alpha, \beta, \gamma \in [0, 1]\). Then:

\[
\begin{align*}
(1) & \quad \overline{V\tilde{R}}_{(a,\beta,\gamma)}^{0.5}(Y) = \bigcup_{v \in [0, 0.5]} \overline{V\tilde{R}}_{(a,\beta,\gamma)}^v(Y); \\
(2) & \quad \overline{V\tilde{R}}_{(a,\beta,\gamma)}^{0.5}(Y) = \bigcap_{v \in [0, 0.5]} \overline{V\tilde{R}}_{(a,\beta,\gamma)}^v(Y).
\end{align*}
\]

**Proof.** The proof is straightforward from Definition 16. \(\square\)

5. An Application in Multi-Attribute Decision Making

In this section, we illustrate the application of the rough set model in generalized single-valued neutrosophic spaces proposed in Section 3.
We present the medical decision procedure based on the proposed rough set model in a single-valued neutrosophic environment as follows.

Assume that the universe $U = \{x_1, x_2, x_3, \cdots, x_n\}$ denotes a set of patients and the universe $V = \{y_1, y_2, y_3, \cdots, y_m\}$ denotes a set of symptoms. Let $\tilde{R}$ be an SVNR from $U$ to $V$. For any $(x_i, y_j) \in U \times V$, $T_{\tilde{R}}(x_i, y_j)$, $I_{\tilde{R}}(x_i, y_j)$, $F_{\tilde{R}}(x_i, y_j)$ represent the truth membership degree, indeterminacy membership degree and falsity membership degree of patient $x_i$ with symptoms $y_j$, respectively. Given a patient $x_i$, the doctor can present the relationship degree decreased by a single-valued neutrosophic number, i.e., $\tilde{R}(x_i, y_j)$ between the patient $x_i$ and the symptom $y_j$. The $(\alpha, \beta, \gamma)$ is given in advance by another doctor and represents the doctors’ lowest requirements on the membership degree. For any $Y \subseteq V$, $Y$ denotes a certain disease and has the basic symptoms $y_j \in Y$. For a patient $x_i$, if $x_i \in \widetilde{R}_{((\alpha,\beta,\gamma))}(Y)$, then we can be sure that the patient $x_i$ is suffering from the disease $Y$ and must receive treatment immediately; if $x_i \in \widetilde{R}_{((\alpha,\beta,\gamma))}(Y) - \widetilde{R}_{((\alpha,\beta,\gamma))}(Y)$, we cannot be sure whether the patient $x_i$ is suffering from the disease $Y$ or not. Therefore, the doctor needs to carry out a second choice to decide whether the patient $x_i$ is suffering from the disease $Y$ or not; if $x_i \in U - \tilde{R}_{((\alpha,\beta,\gamma))}(Y)$, then we can be sure that the patient $x_i$ is not suffering from the disease $Y$ and does not need to receive treatment.

Next, we give an example to illustrate the method above.

**Example 2.** Let $U = \{x_1, x_2, x_3, x_4, x_5\}$ be five patients, $V = \{y_1, y_2, y_3, y_4, y_5, y_6, y_7\}$ be seven symptoms, where $y_j$ $(j = 1, 2, 3, 4, 5, 6, 7)$ stand for “tired”, “a stuffed-up nose”, “headache”, “chill”, “stomach pain”, “dry cough” and “chest-pain”. $\tilde{R}$ is the medical knowledge statistic data of the relationship of the patient $x_i$ $(x_i \in U)$ and the symptom $y_j$ $(y_j \in V)$, and $\tilde{R}$ is an SVNR from $U$ to $V$ (given in Table 2). For any $(x_i, y_j) \in U \times V$, $T_{\tilde{R}}(x_i, y_j)$, $I_{\tilde{R}}(x_i, y_j)$, $F_{\tilde{R}}(x_i, y_j)$ represent the truth membership degree, indeterminacy membership degree and falsity membership degree of patient $x_i$ with symptoms $y_j$, respectively. For example, $\tilde{R}(x_1, y_1) = (0.2, 0.1, 0.8)$ indicates that the truth membership, indeterminacy membership and falsity membership of patient $x_1$ with symptoms $y_1$ is $0.2, 0.1, 0.8$, respectively.

**Table 2.** The single-valued neutrosophic relation $\tilde{R}$ of the symptoms and patients.

</tbody>
</table>

Let $Y = \{y_1, y_2, y_3, y_6\} \subseteq V$ denote a certain disease showing four basic symptoms in the clinic.

Case 1. Take $(\alpha, \beta, \gamma) = (0.5, 0.5, 0.5)$; by Definition 10, we can get the cut relation $\tilde{R}_{(0.5,0.5,0.5)}$ (given in Table 3).

**Table 3.** The cut relation $\tilde{R}_{(0.5,0.5,0.5)}$.

<table>
<thead>

</tbody>
</table>

According to Definition 11, we can get $\tilde{R}_{(0.5,0.5,0.5)}(x_1) = \{y_1, y_2, y_3, y_4, y_6\}$.
(2) We cannot determine whether patient x is suffering from the disease Y or not.
(3) The patient x is not suffering from the disease Y and does not need to receive treatment.

Case 2. Take (α, β, γ) = (0.7, 0.4, 0.3). We can obtain the cut relation \( \tilde{R}_{\{0.7,0.4,0.3\}} \) (given in Table 4).

<table>
<thead>
<tr>
<th>( \tilde{R}_{{0.7,0.4,0.3}} )</th>
<th>y1</th>
<th>y2</th>
<th>y3</th>
<th>y4</th>
<th>y5</th>
<th>y6</th>
<th>y7</th>
</tr>
</thead>

</tr>
<tr>
<td>x5</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

According to Definition 11, we can get
\( \tilde{R}_{\{0.7,0.4,0.3\}}(x_1) = \{y_2, y_3, y_4, y_6\} \),
\( \tilde{R}_{\{0.7,0.4,0.3\}}(x_2) = \{y_1, y_3, y_6\} \),
\( \tilde{R}_{\{0.7,0.4,0.3\}}(x_3) = \{y_5, y_7\} \),
\( \tilde{R}_{\{0.7,0.4,0.3\}}(x_4) = \{y_1, y_6\} \),
\( \tilde{R}_{\{0.7,0.4,0.3\}}(x_5) = \{y_5, y_7\} \).

Then, by Definition 12, we can calculate the lower approximation, the upper approximation, the boundary region and the negative region of Y as follows, respectively.
\( \tilde{R}_{\{0.7,0.4,0.3\}}(Y) = \{x_2, x_4\} \),
\( \tilde{R}_{\{0.7,0.4,0.3\}}(Y) = \{x_1, x_2, x_4\} \),
\( b_{\tilde{R}_{\{0.7,0.4,0.3\}}} (Y) = \{x_1\} \),
\( n_{\tilde{R}_{\{0.7,0.4,0.3\}}} (Y) = \{x_3, x_5\} \).

By Definition 14, we also can calculate the approximate precision of the set Y (Y ⊆ V) as follows:
\( \rho_{\tilde{R}_{\{0.7,0.4,0.3\}}} (Y) = \frac{2}{7} \).

Thus, we can obtain the following conclusions:
(1) Patients x2 and x4 are suffering from the disease Y and must receive treatment immediately.
(2) We cannot determine whether patient x1 is suffering from the disease Y or not.
(3) Patients x3 and x5 are not suffering from the disease Y and do not need to receive treatment.
Based on the above analysis, the proposed model and method could help decision makers make a scientific and precise decision as they face the similar cases in practice. Besides, the model presented in this paper also permits controlling the risk of misdiagnosis in practice.

To explore the effectiveness of the method proposed in this paper, we compare it with the method proposed in [29]. The method given in [29] only deals with the decision making problems with intuitionistic fuzzy information, but not the decision making problems with the single-valued neutrosophic information; while the model proposed in the present paper can handle the decision making problems not only with intuitionistic fuzzy information (since intuitionistic fuzzy sets can be regarded as a special case of SVNSs), but also with single-valued neutrosophic information. Thus, the proposed method is more general, and its application domain is wider than that of the method in [29].

The proposed model is based on the level cut relation of single-valued neutrosophic relations. There are two advantages. One advantage is that the level parameter in the model can control the risk of the misdiagnosis. Another advantage is that the model can approximate the crisp concept by converting a single-valued neutrosophic fuzzy relation into a crisp binary relation.

The rough set method does not depend on any other extra knowledge besides the given dataset. Rough set theory can be applied as a component of hybrid solutions in machine learning and data mining. They have been found to be particularly useful for rule induction and feature selection. Decision makers can control the size of the loss of information by changing the level parameter.

6. Conclusions

In the present paper, based on the \((a, \beta, \gamma)\)-cut relation \(\tilde{R}_{(a, \beta, \gamma)}(a, \beta, \gamma \in (0, 1])\), we propose a new rough set model in generalized single-valued neutrosophic approximation spaces and obtain two extended models of the model. Some properties are studied. Finally, we use an example to illustrate the proposed rough set model’s application in a multi-attribute decision making problem.
