

Supplementary Materials of Assessing Viral Abundance and Community Composition in Four Contrasting Regions of the Southern Ocean

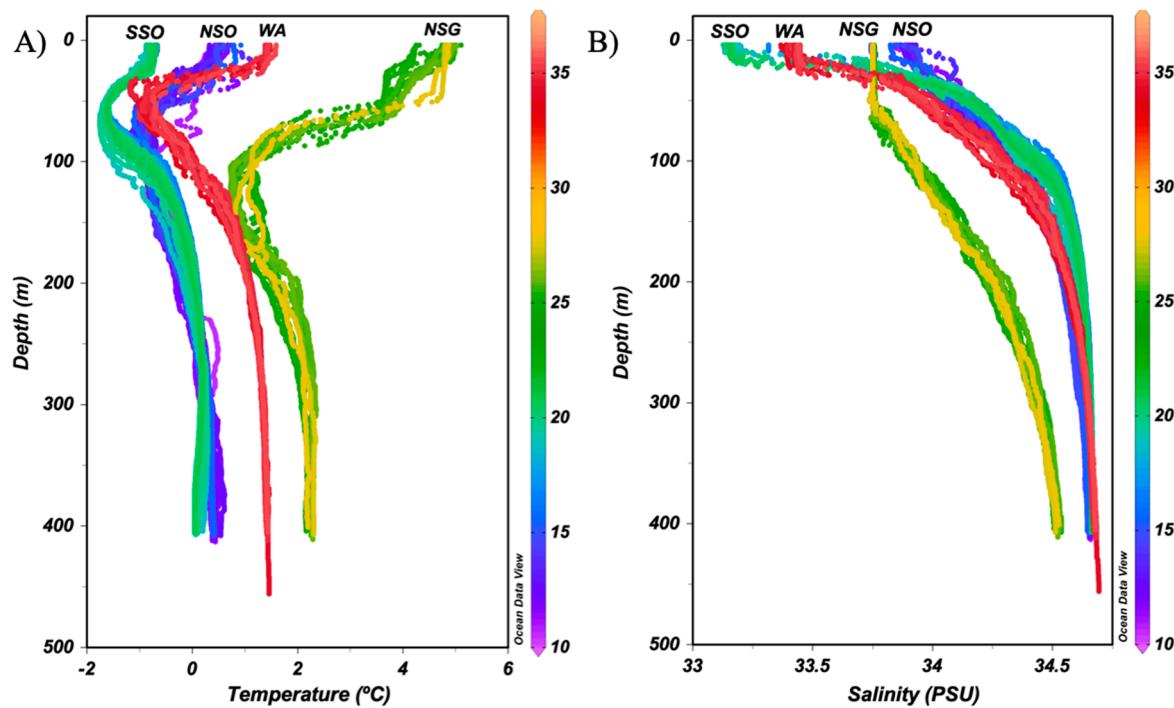

Figure S1. Temperature and salinity profiles. Profiles of (A) Temperature, and (B) Salinity from the four regions registered during the PEGASO expedition. The color indicates different sampling days. See the explanation in Figure 1 for acronyms.

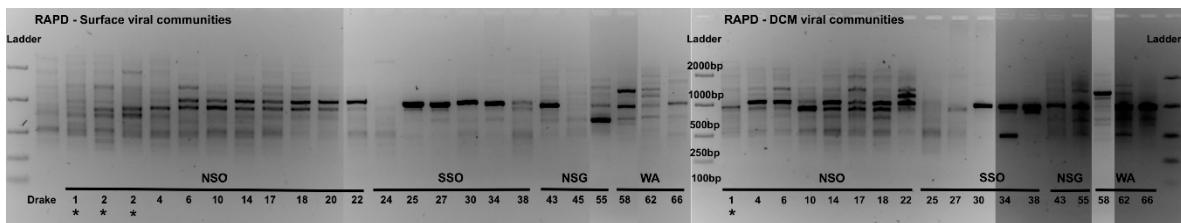

Figure S2. Randomly amplified polymorphic DNA gel image. Gel electrophoresis from viral DNA concentrates from the four regions and both depth layers (Surface and DCM). The numbers below each line indicate the station number. First, middle (indicated) and last lanes are the EasyLadder I (Ladder), Bioline. Molecular weight markers are indicated in base pairs (bp). Sharp differences on the gray shades are due to the side-merge of different gels images (several gels were run in order to work with the best quality gels). Asterisk (*) indicates that those lanes (i.e. stations) were not used in the statistical analyses. See the explanation in Figure 1 for acronyms.

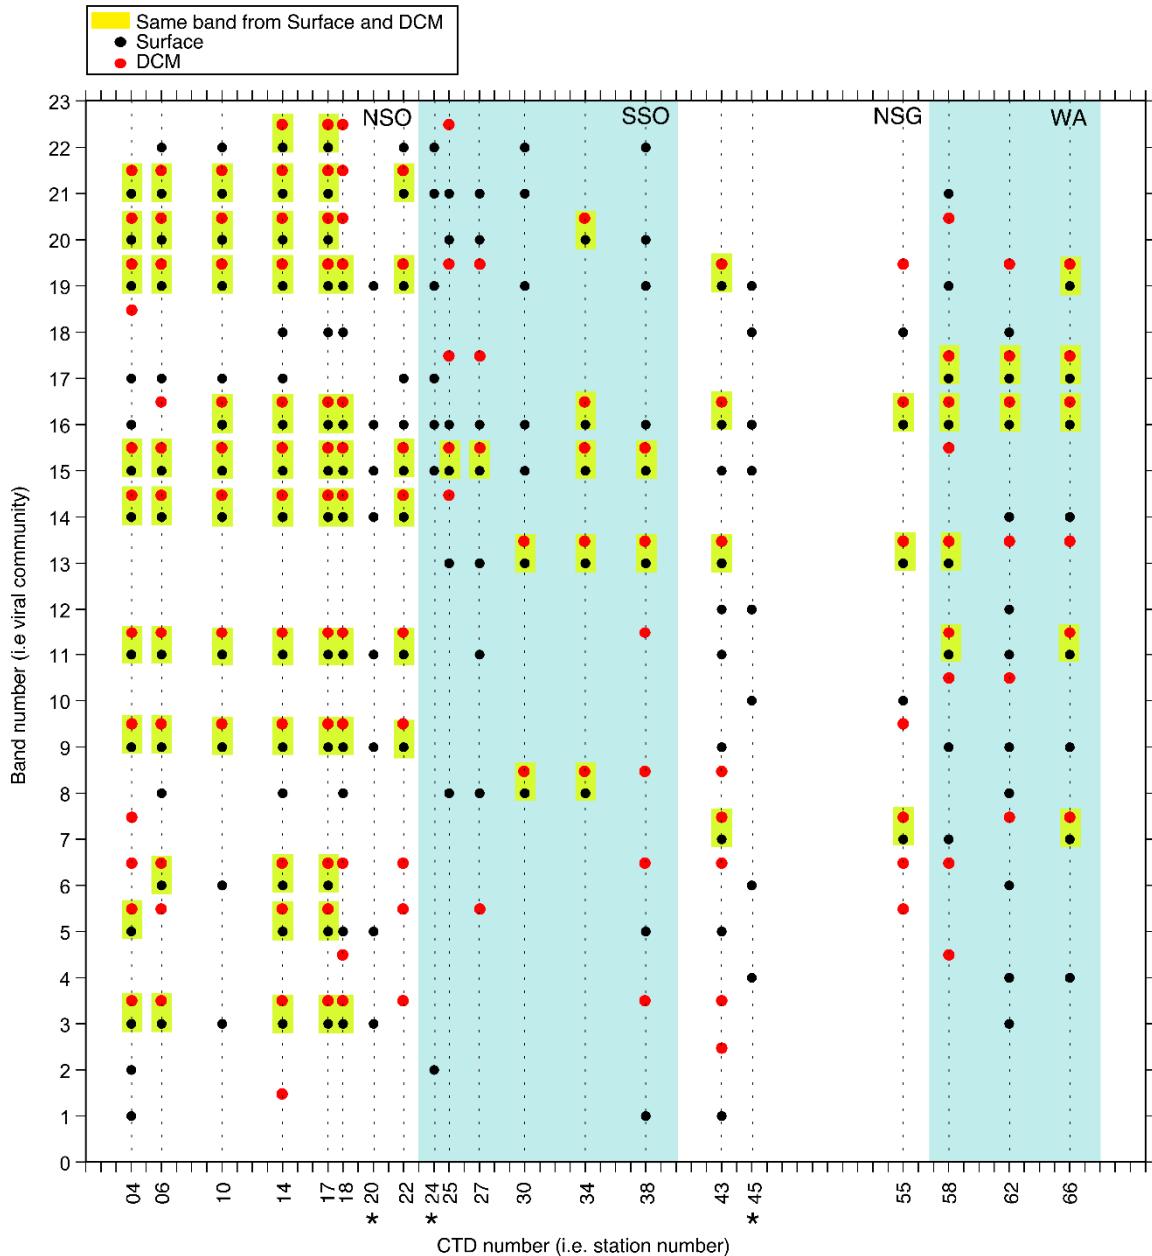

Figure S3. Viral community banding pattern. Summary of the band pattern obtained in the gel electrophoresis (Figure S2). The presence of bands at each station is depicted with a black dot (surface) and a red dot (DCM). When the same band showed up at both depth layers in the same station, a yellow box has been drawn. Asterisk (*) indicates the stations where no diversity samples were measured at the DCM. See the explanation in Figure 1 for acronyms.

NMDS ~ Viral Diversity

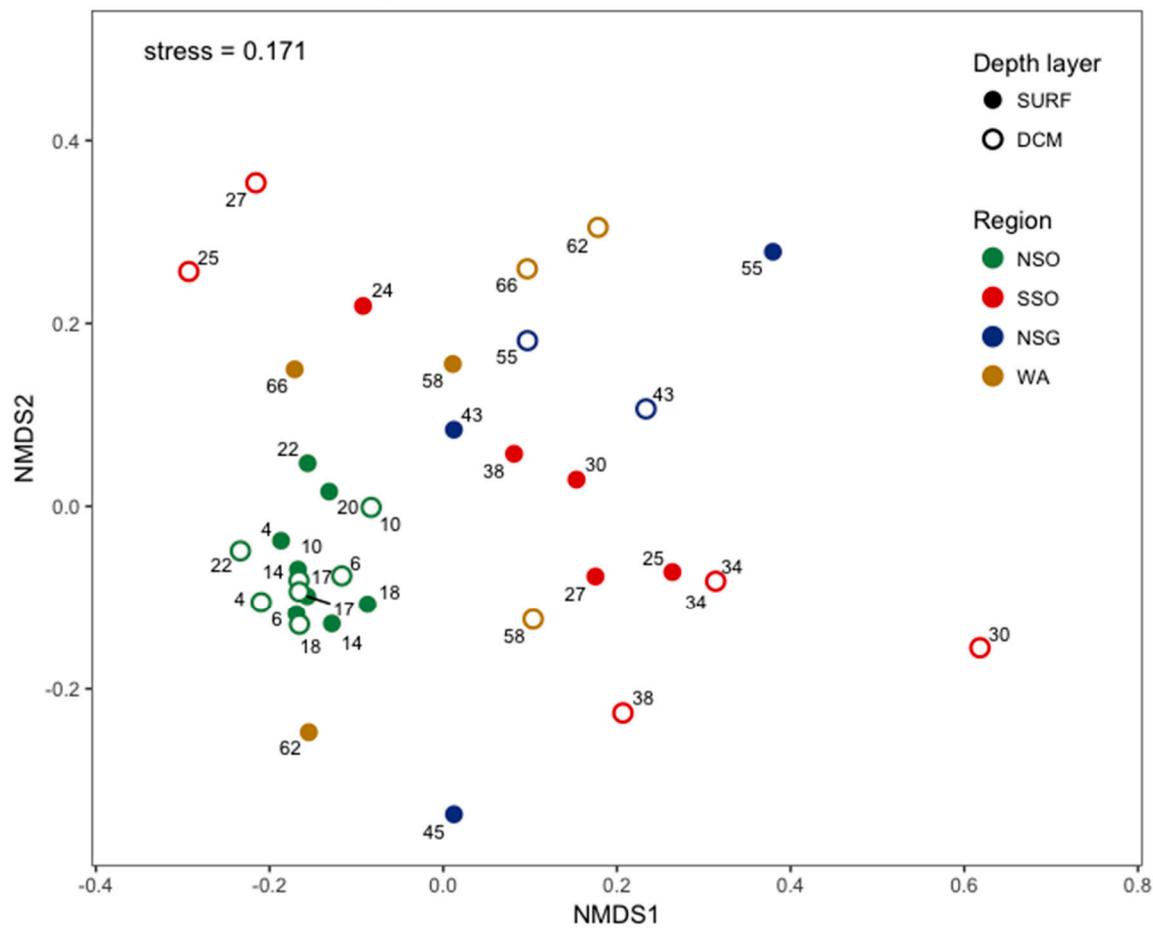

Figure S4. Non-Metric Multidimensional Scaling (NMDS) of the marine viral community composition from surface and DCM plotted together. Full dots represent surface communities and empty circles represent DCM samples. Numbers correspond to the station sampled. See explanation in Figure 1 for acronyms.

Table 1. Physicochemical variables measured during the PEGASO cruise. Sample code: station number and date. Lat (S): Latitude. Long (W): Longitude. Depth (m): surface -4m- and the DCM. Temperature, Salinity, Nutrients: nitrate (NO_3^-), nitrite (NO_2^-), ammonia (NH_4^+), silicate (SiO_4^{2-}), and phosphate (PO_4^{3-}). FDOM: Fluorescence of Dissolved Organic Matter peak-t. See explanation in Figure 1 for acronyms.

Sampling site	Sample code (PEGASO_station number_date[year/month/day])	Lat (S)	Long (W)	Depth (m)	Temperature (°C)	Salinity (PSU)	NO_3^- (μM)	NO_2^- (μM)	NH_4^+ (μM)	SiO_4^{2-} (μM)	PO_4^{3-} (μM)	FDOM (R.U.)

Table 2. Biological variables measured during the PEGASO cruise. Station code: station number and date. Depth (m): surface -4m- and the DCM. V1, V2, and V3: abundances of the different fluorescent-class fractions of the viral counts. Total VA: total viral abundance accounting for all fluorescent classes. VPR: Viral-Prokaryote ratio. Prokaryote Ab.: Prokaryote Abundance. PHP: Prokaryotic heterotrophic production. Chl-a: Chlorophyll a concentration. RAPD: indicates the samples from which analysis of fingerprinting (Randomly Amplified Polymorphic DNA) were performed. See explanation in Figure 1 for acronyms.
