Figure S1. TEM images of HyPEI-supported ZnS nanocrystals. (a,b) Low magnification images of a freshly prepared sample as seen by Hitachi H7650 Zero A TEM instrument; (c) Low magnification FE-TEM micrograph of a freshly prepared sample as seen by a JEOL JEM-2010F FE-TEM instrument; (d1,d2) High magnification FE-TEM micrographs of the locations specified in (c) as seen by a JEOL JEM-2010F FE-TEM instrument; (e,f) Low magnification images of a sample aged for 14 days as seen by a Hitachi H7650 Zero A TEM instrument.

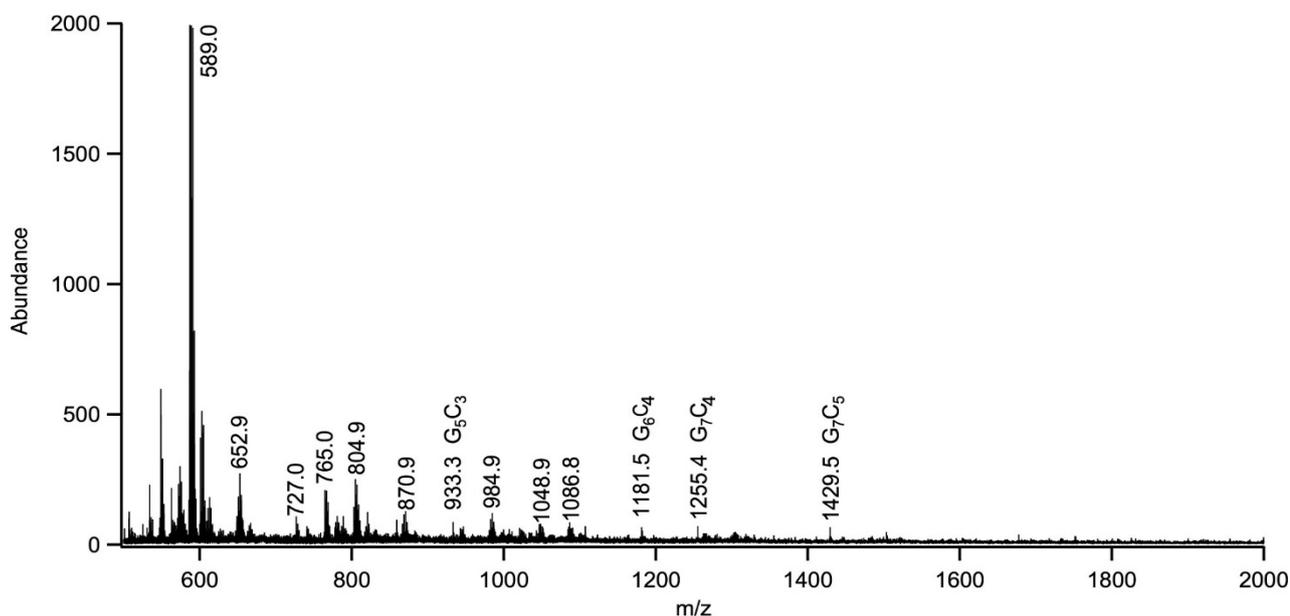

Figure S2. MALDI mass spectrum of the ZnCl₂-bearing glycerol citrate polyester. The mass spec is indicative of a heterogeneous mixture of polymeric species. The assigned peaks indicate the masses consistent with molecular formulae of x glycerol (G) units and y citrate units (C). The assignments were possible in the case of sodiated signals; zinc complexes were difficult to assign unequivocally due to the complexity of the zinc isotopic pattern.

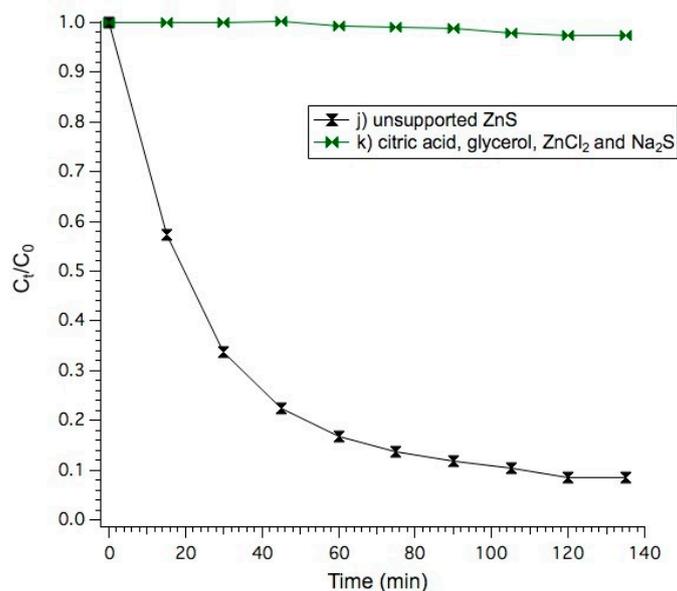

Figure S3. Time-lapse measurement of photodegradation of eosin B (5.0×10^{-5} M, 30 mL) under different conditions: j) with unsupported ZnS particles, under UV, k) with *unreacted* citric acid, glycerol, ZnCl₂, Na₂S, under UV.
