Table S1. Monoclonal antibodies used for immunophenotyping of leukemia patients by flow cytometry.

Table S2. Total number, average age and gender distribution of leukemia patients included in the study.

Table S3. Sensitivity of tumor cells to chemotherapeutic drugs (WST-test data), treatment regimens and therapy response of patients with acute and chronic leukemia with scales for correlation analysis (in parentheses).

Table S4. Immunological markers and cytogenetic abnormalities detected in tumor cells of patients with acute and chronic leukemia with scales for correlation analysis (in parentheses).

Table S5. Correlation coefficients reflecting the relationships between the drug sensitivity and expression of immunological markers in tumor cells of patients with acute myeloid leukemia.

Table S6. Correlation coefficients reflecting the relationships between the drug sensitivity and cytogenetic abnormalities in tumor cells of leukemia patients.

Table S7. Correlation coefficients reflecting the relationships between the drug sensitivity and expression of immunological markers in tumor cells of patients with acute lymphoblastic leukemia.

Table S8. Correlation coefficients reflecting the relationships between the drug sensitivity and expression of immunological markers in tumor cells of patients with chronic lymphocytic leukemia.

Table S9. Correlation coefficients reflecting the relationships between the drug sensitivity, *MDR1* mRNA and P-glycoprotein expression in tumor cells of leukemia patients.

Red color indicates strong positive correlation ($0.70 \leq r_s \leq 1.00$), blue color indicates moderate positive correlation ($0.30 \leq r_s \leq 0.69$), and green color indicates weak positive correlation ($0.01 \leq r_s \leq 0.29$). Shortening of the dox. denotes doxorubicin, shortening of the daun. denotes daunorubicin, shortening of the cyt. denotes cytarabine.
