**Table S2: Mapping of HLA genotype in association with humoral vaccination response in 33 KTR.** The following table shows the HLA genotype of 33 KTR patients currently on the waiting list for kidney transplantation. In red are the HLA alleles that have been associated with severe COVID-19 disease progression in Europe. In our data, there is no association with a lack of or weak humoral vaccine response and the known alleles leading to more severe COVID-19. Rather, the results can be related to the strength of immunosuppression. However, due to the small number of patients, the data are limited.

patient	HLA-genotyp					vaccination response

**Table S3: Mapping of HLA genotype in association with humoral vaccination response in 15 HDP.** The following table shows the HLA genotype of 15 dialysis patients currently on the waiting list for kidney transplantation. In red are the HLA types that have been associated with severe COVID-19 disease progression in Europe. In our data, there is no correlation between a reduced vaccination response and the HLA characteristics that appear to be associated with more severe COVID-19 disease. Likewise, no association with individual other HLA types could be shown. However, the very small number of patients is limiting.

**Figure S1: Humoral vaccine response measured by SARS-CoV-2 specific anti-spike antibodies referred to immunosuppression and timepoint of transplantation in KTR.** Figure S1 a) shows the vaccination response measured by anti-spike (s) IgG antibodies referred to dual or triple immunosuppression regime at 1 month after the 1<sup>st</sup> vaccination (V1) and 1 month (V2) after the 2<sup>nd</sup> vaccination and 6 months (V3) after 1<sup>st</sup> vaccination. The x-axis represents the time points of measurement of vaccination response; the y-axis represents the anti-spoke antibody titer in AU/ml. Figure S1 b) shows the vaccination response in KTR measured by anti-spoke (s) IgG antibodies divided into how long

*ago the kidney transplant was performed at the time of the vaccination control at V1, V2 and V3. The x-axis represents the time points of measurement of vaccination response; the y-axis represents the anti-spike antibody titer in AU/ml.*
