Figure S1. Sequence of the *Bcbva sigK* gene before and after excision of the insertion. Primers sigK-for and sigK-rev are indicated in bold, primers sigK-3 and sigK-4 in blue, and bases at the recombination site in red and green. The 16-bp imperfect inverted repeats are underlined.

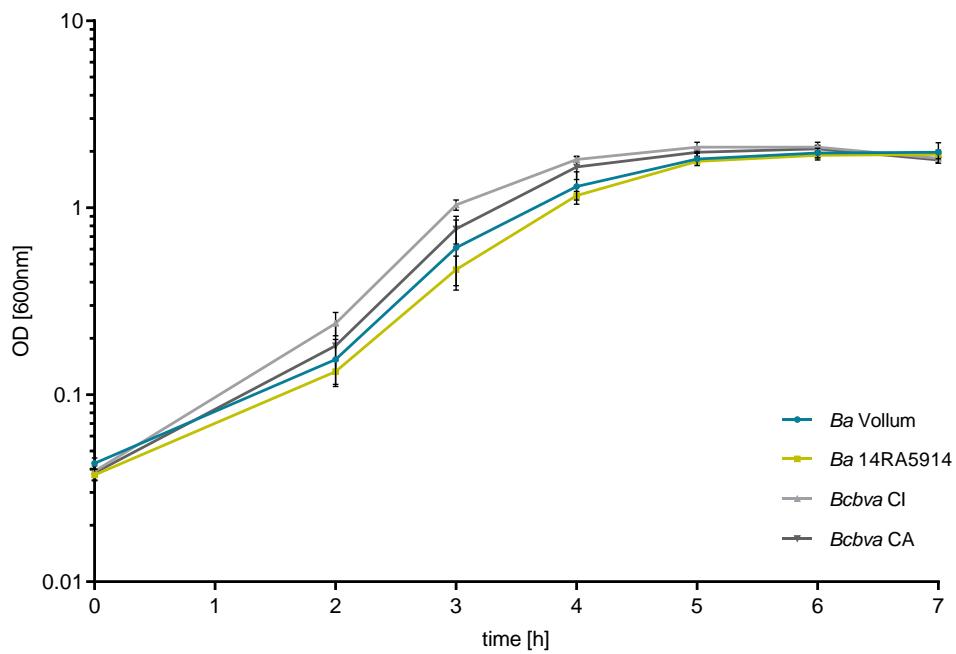

Figure S2. Growth curves of *Ba* and *Bcbva* strains in sporulation medium MGM. Averages and standard errors based on 3 independent replicates were calculated using the GraphPad Prism 9 Software.

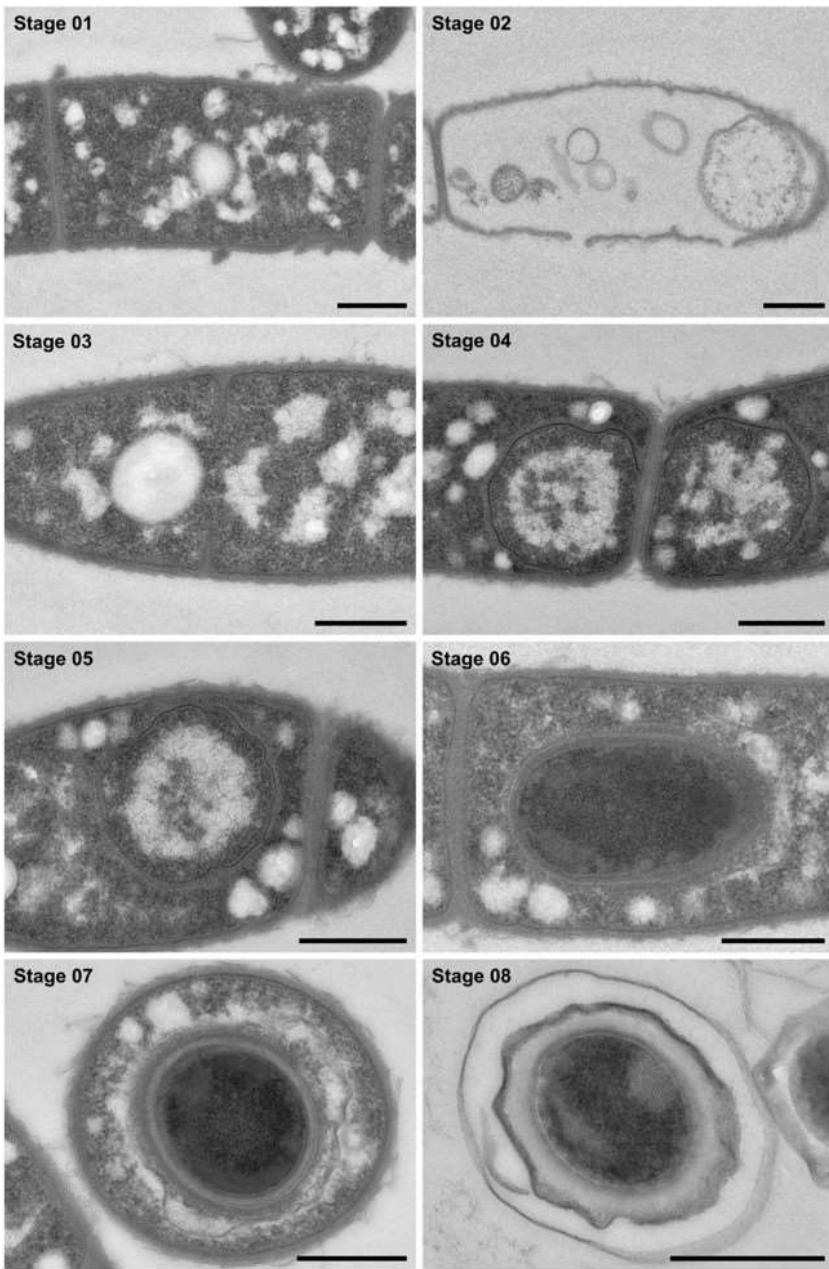

Figure S3. Sporulation stages of *Ba* 14RA5914 illustrated by transmission electron microscopy (TEM). Stage 1, vegetative cell; stage 2, lytic cell; stage 3, dividing cell; stage 4, beginning of engulfment; stage 5, end of engulfment; stage 6, end of engulfment and beginning of spore differentiation; stage 7, differentiated intracellular spore; stage 8, extracellular spore. Bars represent 500 nm.

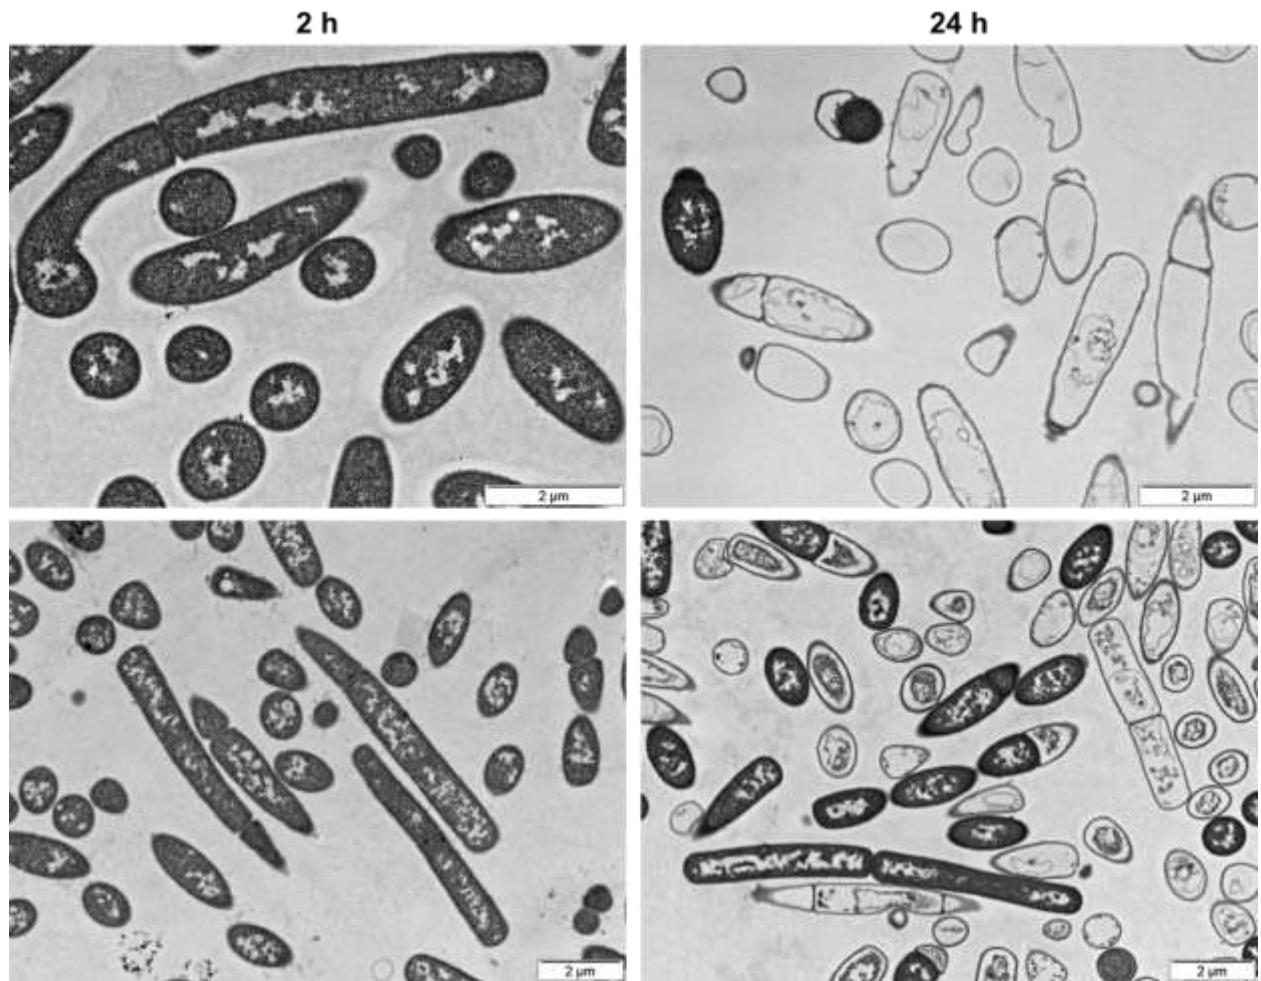

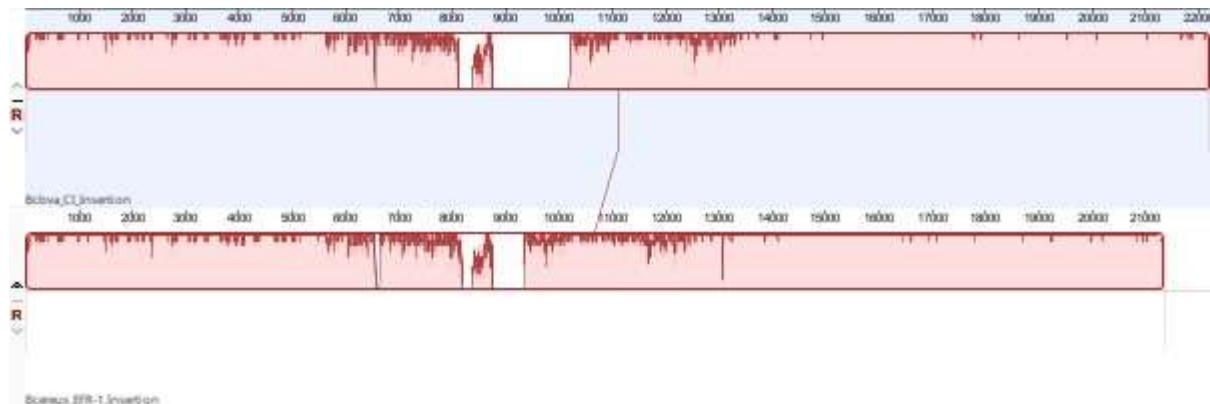

Figure S4. Representative TEM images of sections from *Bcbva* Cl-12 (upper panel) and CA-2 (lower panel) grown for 2 or 24 hours in sporulation medium MGM. At 2 h of incubation in MGM bacteria reveal the typical ultrastructure of vegetative bacteria. After 24 h of incubation in MGM most cells appear extracted or show a condensed cytoplasm, but no spores or stages of sporulation.

C

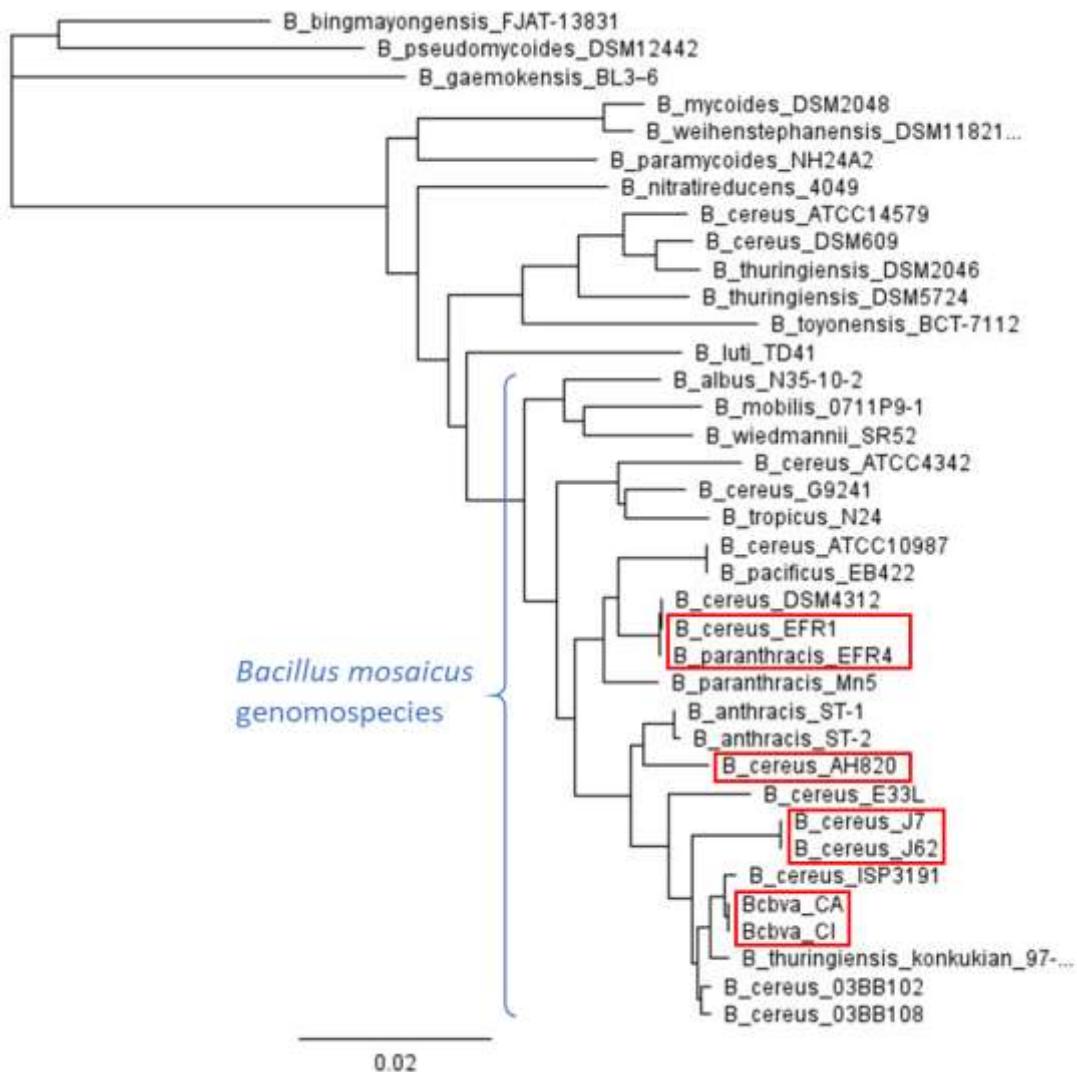

Figure S5. Strains possessing insertions in the *sigK* gene and comparison of corresponding sequences.

A: Mauve alignment (created in Geneious version 2021.2) of the *sigK* insertions of *Bcbva* CI (upper graph) and *B. cereus* EFR-1 (lower graph) indicating homologous and unique sequences.

B: Comparison of the insertion sites in *Bcbva*, further strains of the *B. cereus* group, and *B. subtilis*. A 18 bp imperfectly repeated sequence within which the recombination takes place in *Bcbva* and *B. paranthracis* EFR4/*B. cereus* EFR1 is highlighted in grey. The AATGA sequence at the recombination site (if present) is indicated in bold, inverted repeats are underlined.

C: Neighbor-Joining tree (created in Geneious version 2021.2) based on the concatenated sequences of the seven housekeeping genes *glp*, *gmk*, *ilv*, *pta*, *pur*, *pyc*, *tpi* (<https://pubmlst.org/organisms/bacillus-cereus>). Strains containing insertions in the *sigK* gene are members of the *Bacillus mosaicus* genomospecies and belong to sequence types ST 26 (*B. cereus* EFR-1 and *B. paranthracis* EFR-4), ST 460 (*B. cereus* AH820), ST 167 (*B. cereus* J7 and J62) and ST 935 (*Bcbva* CI and CA).
