Table S3. Questions from the Joanna Briggs Institute Prevalence Critical Appraisal Tool.

No.	Criteria	Yes	No	Unclear	Not applicable
1	Was the sample representative of the target population?				
2	Were study participants recruited in an appropriate way?				
3	Was the sample adequate?				
4	Were the study subjects and the setting described in detail?				
5	Was the data analysis conducted with sufficient coverage of the identified sample?				
6	Were objective, standard criteria used for the measurement of the condition?				
7	Was the condition measured reliably?				
8	Was there appropriate statistical analysis?				
9	Are all important confounding factors/subgroups/differences identified and accounted for?				
10	Were subpopulations identified using objective criteria?				

Table adapted from Munn et al. (2014).

Figure 1. Results of meta-regression analyses of the prevalence of *Toxascaris leonina* infection in dogs and cats according to: (panel A) demonstrating a statistically non-significant decreasing trend in prevalence over time in more recent years; (panels B and C) geographical latitude and longitude, showing statistically non-significant downward trend in prevalence with increasing geographical latitude and longitude; (panel D) relative humidity, showing statistically significant downward trend in prevalence with increasing relative humidity; and (panels E and F) mean environmental temperature and annual precipitation, showing non-statistically significant upward and downward trend in prevalence in areas with a higher mean temperature and relative humidity, respectively. “ES” refers to effect size (= prevalence rates).
