The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

**Table S1b ( $\log_{10}$  CFU). Calculated numeric values for the scenario when day-old chicks are set positive ( $10^1$  CFU bacteria per chick on day 1). The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

**Table S3b ( $\log_{10}$  CFU). Calculated numeric values for the scenario when chicks are set positive with  $10^1$  CFU bacteria per chick on day 3.** Setting. 20 chicks, 4 seeder, 16 sentinels, Ross 308, target weight 2 kg, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and 20 chicken ( 4 seeders and 16 sentinels )**

**Figure S4. Calculated infection dynamic for the scenario when chicks are set positive with  $10^2$  CFU bacteria per chick on day 3.** Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Ross 308, target weight 2.332 kg, feeding duration 36 days, stocking density  $39 \text{ kg/m}^2$ ,  $1000 \text{ g litter/m}^2$

**Table S4a (CFU). Calculated numeric values for the scenario when chicks are set positive with 10<sup>2</sup> CFU bacteria per chick on day 3.** Setting: 20 chicks, 4 seeder, 16 sentinels, Ross 308, target weight 2 kg, feeding duration 21 days, stocking density 39 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and 20 chicken ( 10 seeders and 10 sentinels )**

**Figure S5. Calculated infection dynamic for the scenario when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 3).** Dotplots with results for 20 chicks, 10 seeder, 10 sentinels, Ross 308, target weight 2 kg, feeding duration 36 days, stocking density  $39 \text{ kg/m}^2$ ,  $1000 \text{ g litter/m}^2$

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and**

**90 chicken ( 18 seeders and 72 sentinels )**

**Figure S6. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1; reference).** Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density  $39 \text{ kg/m}^2$ , litter  $1000\text{g/m}^2$

**Table S6a (CFU). Calculated numeric values for scenario when day-old chicks are set positive positive (102 CFU bacteria per chick on day 1; reference).** Setting 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, litter 1000 g/m<sup>2</sup>

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

**Corresponding Table S7b ( $\log_{10}$  CFU). Calculated numeric values for scenario when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure 3000 g litter/m<sup>2</sup>. Setting: 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, 3000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and  
90 chicken ( 18 seeders and 72 sentinels )**

**Figure S8. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure 6000 g litter/m<sup>2</sup>. Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>; 6000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

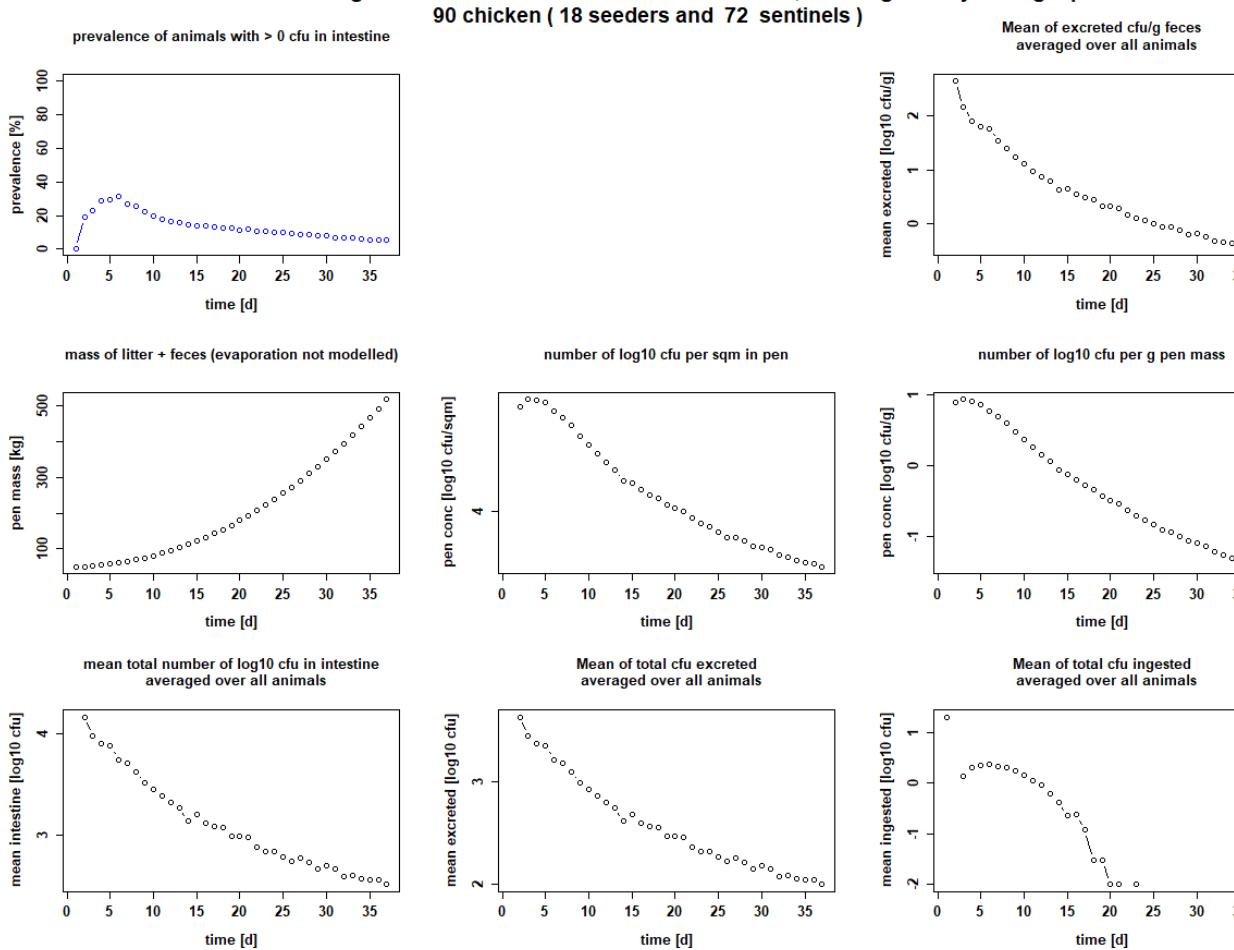

**Table S8b ( $\log_{10}$  CFU). Calculated numeric values for scenario when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure 6000 g litter/m<sup>2</sup>. Setting: 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>; 6000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and**

**90 chicken ( 18 seeders and 72 sentinels )**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Figure S10. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure slow growing breed.** Dotplots with results for 90 chicks, 18 seeders, 72 sentinels, Rowan x Ranger, feeding duration 47 days, stocking density  $39 \text{ kg/m}^2$ ;  $1000\text{g litter/m}^2$

**Table S10a (CFU). Calculated numeric values for scenario when day-old chicks are set positive (10<sup>2</sup> CFU bacteria per chick on day 1), measure slow growing breed.** Setting: 90 chicks, 18 seeder, 72 sentinels, Rowan x Ranger, feeding duration 47 days; stocking density 39 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 25 kg/sqm and**

**90 chicken ( 18 seeders and 72 sentinels )**

**Figure S11. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure stocking density  $25 \text{ kg/m}^2$ . Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density  $25 \text{ kg/m}^2$ ,  $1000 \text{ g litter/m}^2$**

**Table S11a (CFU). Calculated numeric values for scenario when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure stocking density 25 kg/m<sup>2</sup>. Setting: 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days; stocking density 25 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

**Table S12b ( $\log_{10}$  CFU). Calculated numeric values for scenario when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure stocking density 20 kg/m<sup>2</sup>. Setting: 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days; stocking density 20 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 25 kg/sqm and**

**90 chicken ( 18 seeders and 72 sentinels )**

**Figure S13. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), combined measures litter  $3000 \text{ g/m}^2$  and stocking density  $25 \text{ kg/m}^2$ . Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density  $25 \text{ kg/m}^2$ ,  $3000 \text{ g litter/m}^2$**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 20 kg/sqm and**

**90 chicken ( 18 seeders and 72 sentinels )**

**Figure S14. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), combined measures litter  $3000 \text{ g/m}^2$  and stocking density  $20 \text{ kg/m}^2$ . Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density  $20 \text{ kg/m}^2$ ,  $3000 \text{ g litter/m}^2$**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: rowan ranger , stocking density: 25 kg/sqm and 90 chicken ( 18 seeders and 72 sentinels )**

**Figure S15. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), combined measures slow growing breed, stocking density 25 kg/m<sup>2</sup> and litter 3000 g/m<sup>2</sup>. Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Rowan x Ranger, feeding duration 47 days, stocking density 25 kg/m<sup>2</sup>, 3000 g litter/m<sup>2</sup>**

**Table S15a (CFU). Calculated numeric values for scenario when day-old chicks are set positive (10<sup>2</sup> CFU bacteria per chick on day 1), combined measures slow growing breed, stocking density 25 kg/m<sup>2</sup> and litter 3000 g/m<sup>2</sup> Setting: 90 chicks, 18 seeder, 72 sentinels, Rowan x Ranger, feeding duration 47 days, stocking density 25 kg/m<sup>2</sup>, 3000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and**

**90 chicken ( 18 seeders and 72 sentinels )**

**Figure S16. Calculated infection dynamic when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure lower growth rate for ESBLs in the intestines.** Dotplots with results for 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>

**Table S16a (CFU). Calculated numeric values for scenario when day-old chicks are set positive ( $10^2$  CFU bacteria per chick on day 1), measure lower growth rate for ESBLs in the intestines. Setting: 90 chicks, 18 seeder, 72 sentinels, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Figure S17. Calculated infection dynamic for the scenario when the pen is contaminated with  $10^5$  CFU ( $10^5$  CFU in  $5.38 \text{ kg/litter/m}^2$ ; i.e.  $1.27 \log_{10}/\text{g litter}$ ) at the beginning of the fattening period (day 1).** Dotplots with results for 90 negative birds, Ross 308, feeding duration 36 days, stocking density  $39 \text{ kg/m}^2$ ,  $1000 \text{ g litter/m}^2$  (no infection of birds, thus no plots).

**Table S17a (CFU). Calculated numeric values for scenario when the pen is contaminated with  $10^5$  CFU ( $10^5$  CFU in 5.38 kg/litter/m<sup>2</sup>; i.e.  $1.27 \log_{10}/\text{g litter}$ ) at the beginning of the fattening period (day 1).** Setting: 90 negative birds, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

**Table S18b ( $\log_{10}$  CFU). Calculated numeric values for scenario when the pen is contaminated with  $10^6$  CFU ( $10^6$  CFU in  $5.38 \text{ kg/litter/m}^2$ ; i.e.  $2.27 \log_{10}/\text{g litter}$ ) at the beginning of the fattening period (day 1; reference).** Setting: 90 negative birds, Ross 308, feeding duration 36 days, stocking density  $39 \text{ kg/m}^2$ ,  $1000 \text{ g litter/m}^2$

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and 90 chicken ( 0 seeders and 90 sentinels )**

**Figure S19. Calculated infection dynamic for the scenario when the pen is contaminated with  $10^6$  CFU at the beginning of the fattening period, measure 3000 g litter/m<sup>2</sup>. Dotplots with results for 90 negative birds, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, 3000 g litter/m<sup>2</sup>**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Figure S20. Calculated infection dynamic for the scenario when the pen is contaminated with  $10^6$  CFU at the beginning of the fattening period, measure 6000 g litter/m<sup>2</sup>.** Dotplots with results for 90 negative birds, Ross 308, feeding duration 36 days, stocking density 39 kg/m<sup>2</sup>, 6000 g litter/m<sup>2</sup> (no infection of birds, thus no plots).

**Table S20a (CFU). Calculated numeric values for scenario when the pen is contaminated with  $10^6$  CFU at the beginning of the fattening period, measure 6000 g litter/m<sup>2</sup>. The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Figure S22. Calculated infection dynamic for the scenario when the pen is contaminated with  $10^6$  CFU at the beginning of the fattening period, measure slow growing breed.** Dotplots with results for 90 negative birds, Rowan x Ranger, feeding duration 47 days, stocking density  $39 \text{ kg/m}^2$ ,  $1000 \text{ g litter/m}^2$

**Table S22a (CFU). Calculated numeric values for scenario when the pen is contaminated with 106 CFU at the beginning of the fattening period, measure slow growing breed.** Setting: 90 negative birds, Rowan x Ranger, feeding duration 47 days, stocking density 39 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 25 kg/sqm and**

**90 chicken ( 0 seeders and 90 sentinels )**

**Figure S23. Calculated infection dynamic for the scenario when the pen is contaminated with  $10^6$  CFU at the beginning of the fattening period, measure stocking density 25 kg/m<sup>2</sup>. The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

**Table S24b ( $\log_{10}$  CFU). Calculated numeric values for scenario when the pen is contaminated with  $10^6$  CFU at the beginning of the fattening period, measure stocking density 20 kg/m<sup>2</sup>.**

Setting: 90 negative birds, Ross 308, feeding duration 36 days, stocking density 20 kg/m<sup>2</sup>, 1000 g litter/m<sup>2</sup>

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Figure S25. The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations.

**Table S27b ( $\log_{10}$  CFU). Calculated numeric values for scenario when the pen is contaminated with  $10^6$  CFU at the beginning of the fattening period, combined measure slow growing breed, stocking density 25 kg/m<sup>2</sup> and 3000 g litter/m<sup>2</sup>. Setting: 90 negative birds, Rowan x Ranger, feeding duration 47 days, stocking density 25 kg/m<sup>2</sup>, 3000 g litter/m<sup>2</sup>**

**Model results averaged of all birds and iterations with breed: rowan ranger, stocking density: 25 kg/sqm and 90 chicken (0 seeders and 90 sentinels)**

The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).

**Model results averaged over all 100 iterations with breed: ross , stocking density: 39 kg/sqm and 90 chicken ( 0 seeders and 90 sentinels )**  
 prevalence of animals with > 0 cfu in intestine

**Figure S28. The average of the prevalence, the CFU-values per square meter (cfu/sqm) and per gram manure are calculated over all iterations. The CFU values in the intestine as well as the excreted and ingested quantities are obtained by calculating the average over all animals in one iteration at first and then over all iterations. The decadic logarithm of zero or negative values is negative infinite (-Inf).
