

Supplementary material

Table S1. Resume of the taxonomic and phenotypic characterization of the bacterial isolates. Columns indicate in order: Strain name, haplotype, Taxonomic attribution (NCBI), quantification of IAA production, results of the growth in presence of stress conditions, and row values of halos in disk diffusion assay against seeds extract and solvent (EtOH 80%).

Strain	Haplotype	Taxonomy	Isolation source	mg IAA/1.5 x 10 ⁸ cells	Results of the growth under stress conditions, expressed for each test as the % of growth with respect to the control (bacterial inoculum in MHB medium). The % values are calculated on the bases of the measured absorbances, as described in materials and methods.					Row values of halo measures (mm) in the disk diffusion assay against the seeds extracts. Tests showing no halo (complete resistance) are indicated with the number 6, that correspond to the diameter of the disk, and was used to normalize the data in the matrix used for the heatmap construction (Fig. 3)
