

Supplementary Materials

In Vitro Susceptibility to Miltefosine of *Leishmania infantum* (syn. *L. chagasi*) Isolates from Different Geographical Areas in Brazil.

Caroline Ricce Espada ^{1,†}, Erica V. de Castro Levatti ^{1,†}, Mariana Côrtes Boité ², Dorcas Lamounier ³, Jorge Alvar ⁴, Elisa Cupolillo ², Carlos Henrique Nery Costa ³, Joelle Rode ⁵ and Silvia R. B

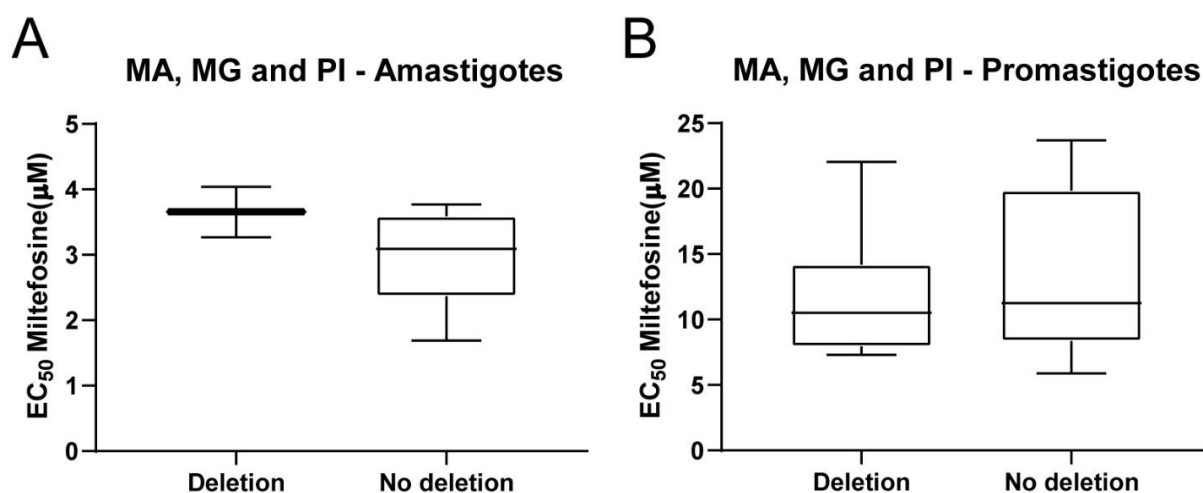

Figure S1. Susceptibility to miltefosine in *L. infantum* strains presenting (MSL+) or not (MSL-) the MSL locus. EC₅₀ was determined in amastigotes (A) or promastigotes (B). Distribution analysis performed with strains originating from Piauí, Maranhão and Minas Gerais Brazilian states. The central line in the box-plot represents the median values of each analyzed group.
