

Table S5. Effect of treatment (unamended soil, amended soil with young maize plants or its neutral detergent fibre) and effect of soil (EC: 1.9 dS m⁻¹, 17.3 dS m⁻¹, 33.4 dS m⁻¹) on bacterial phyla or genera using a compositional approach, i.e. analysis of differential abundance taking sample variation into account (ALDEx2 package [39]).

Soil ^a		Treatment	
Phyla			
Acidobacteria	2.99×10 ⁻¹⁰ ^b	Verrucomicrobia	1.00×10 ⁻⁴

^a Only ten phyla and twenty genera most significantly affected by soil EC $P < 0.001$ and with the lowest p values obtained are given, ^b The expected values of the Kruskal-Wallis test for each feature obtained with `aldex.kw` argument with converted sequence data using the centered log-ratio transform test returned by the `aldex.clr` argument ALDEx2 package.
