For two species, correct identification depended on the gender of the respondents. The Hooded Crow was correctly identified by 82% of men and 74% of women ($\chi^2 = 11.088$, df = 1, p < 0.001, η^2: 0.0064). In contrast, the Rook was correctly identified by 66% of men and 58% of women ($\chi^2 = 8.691$, df = 1, p = 0.003, η^2: 0.005). Age had no effect on species knowledge except in cases of Magpie ($\chi^2 = 16.823$, df = 3, p = 0.001, η^2: 0.0097) and Jay ($\chi^2 = 12.55$, df = 3, p = 0.006, η^2: 0.0072) because older age groups were more successful in recognizing these species.
