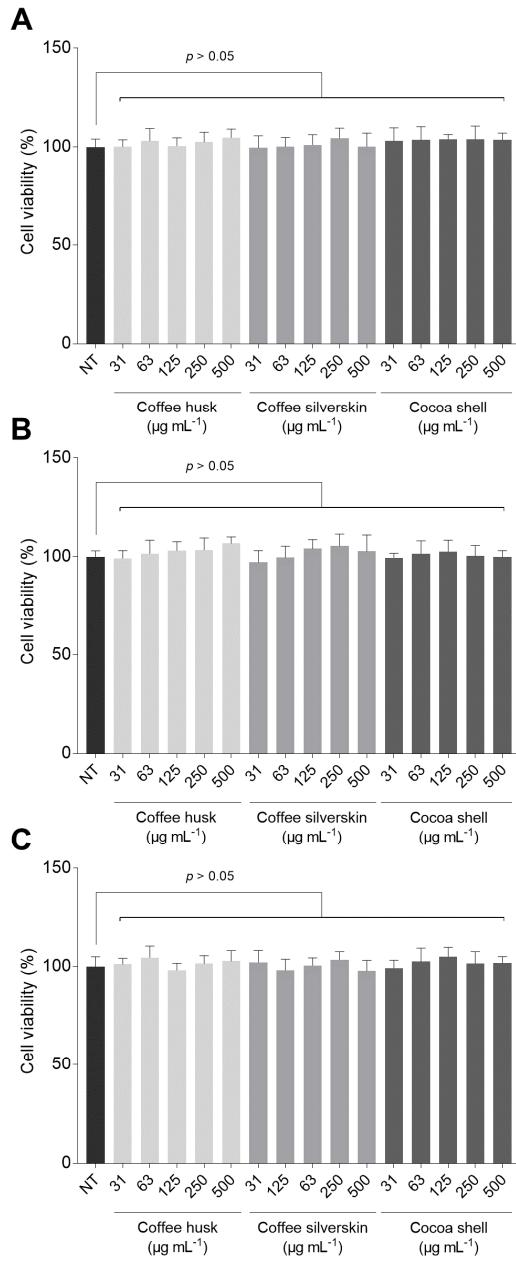

Figure S1. Impact of treatments on cell viability of (A) RAW264.7 macrophages, (B) 3T3-L1 preadipocytes, and (C) 3T3-L1 differentiated adipocytes. Cells were treated in the absence (NT) or presence of coffee husk, coffee silverskin, or cocoa shell aqueous extracts (31–500 µg mL⁻¹) for 24 h, after which, the cell viability was determined using an MTS colorimetric assay. The results are expressed as mean ± SD ($n = 3$). NT: non-treated cells.

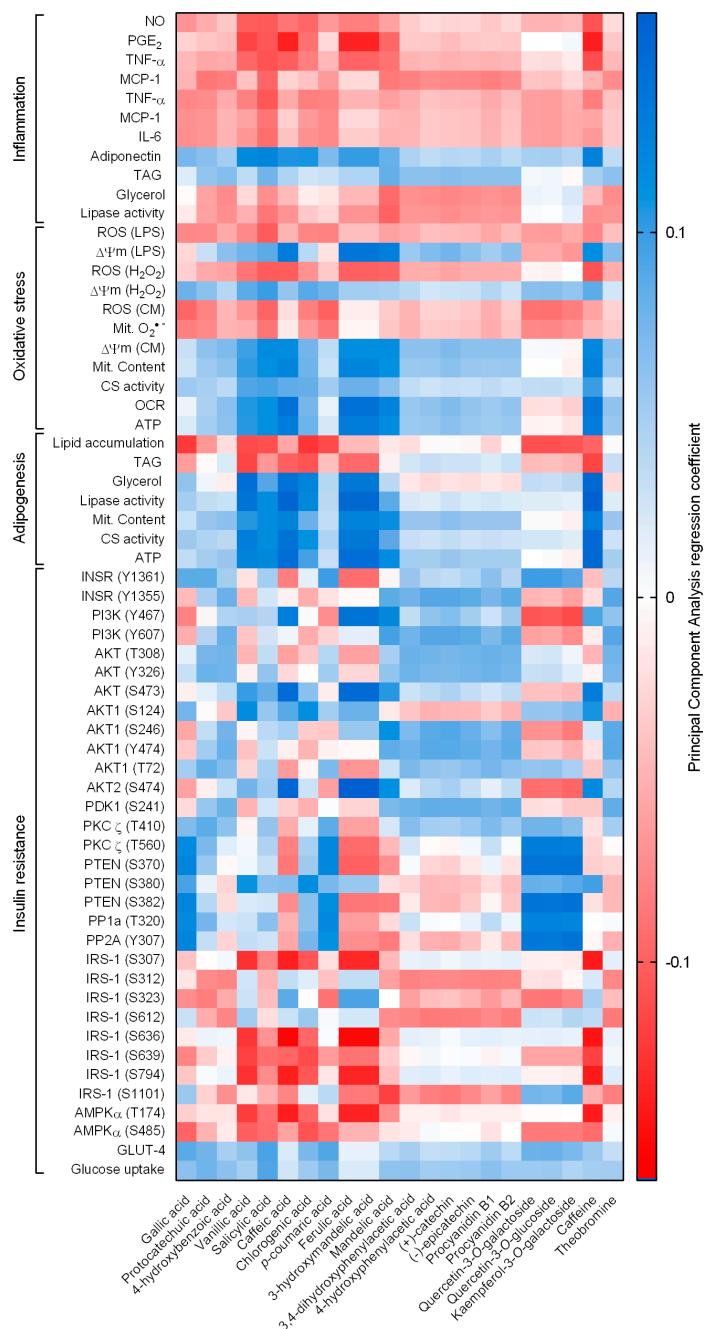

Figure S2. Heat map including standardized principal component regression (PCR) coefficient of the regression constructed among the phytochemicals found in coffee husk, coffee silverskin, and cocoa shell aqueous extracts and the potential of the extracts in the different biomarkers of inflammation, oxidative stress, adipogenesis, and insulin resistance.

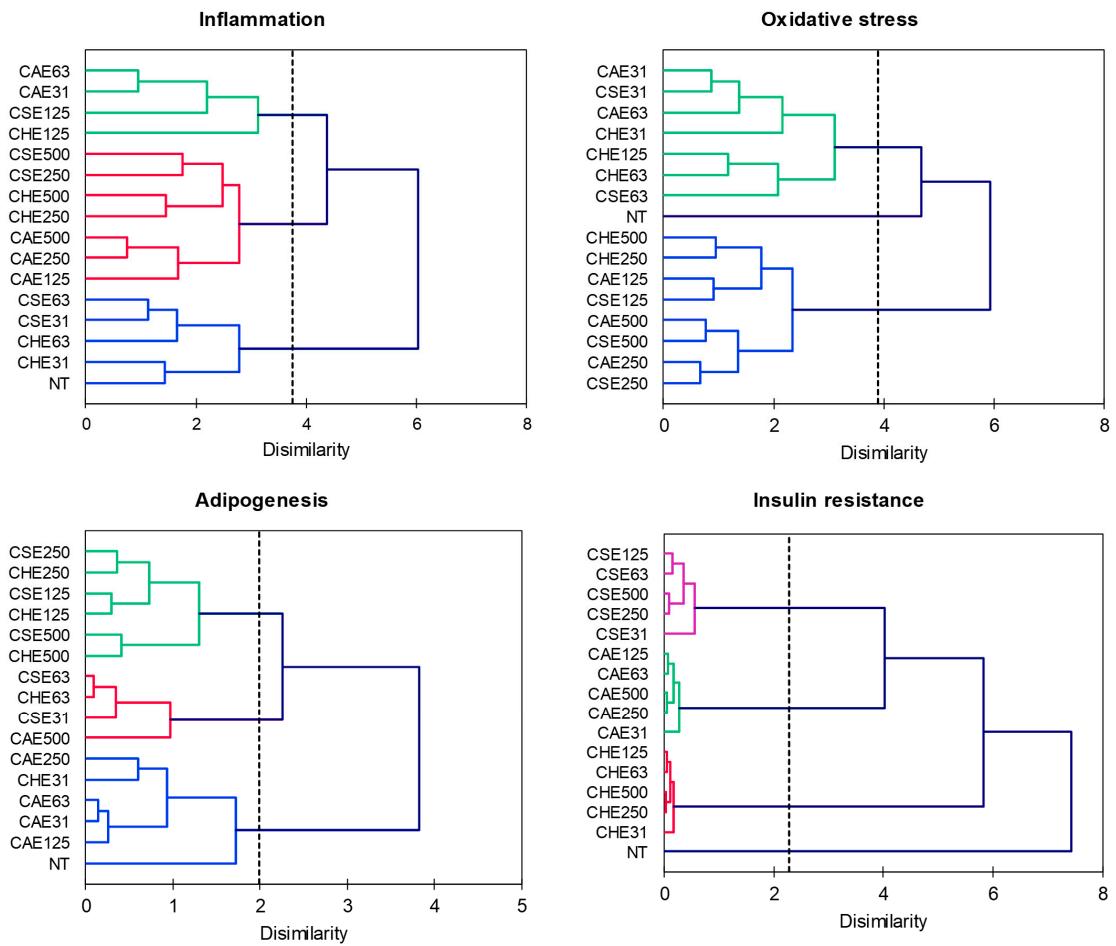

Figure S3. Dendrograms of hierarchical cluster analysis of the treatments of coffee husk (CHE), coffee silverskin (CSE), and cocoa shell (CAE) on the different in vitro models od inflammation, oxidative stress, adipogenesis, and insulin resistance. All the variables in each group of biological activity were included. NT: non-treated cells

Table S1. Anti-inflammatory effect of coffee husk, coffee silverskin, and cocoa shell extracts regulating NO, PGE2, TNF- α , and MCP-1 release in LPS-stimulated RAW264.7 macrophages, and TNF- α , MCP-1, IL-6, adiponectin, intracellular triglyceride content, extracellular glycerol release, and lipase activity CM-stimulated in 3T3-L1 adipocytes. Values are expressed as mean \pm SD ($n = 3$). Different letters among rows (same concentration) indicate significant differences ($p < 0.05$) according to ANOVA and Tukey's multiple range test.
