Figure S1. Illustration of generating spike consensus sequences using SARS-CoV-2 and bat SL-CoV as examples.

Key:

See steps 1–4. Males labelled MS, HS and females by their abdts A, B

Sec. struc: Helices labelled H1, H2, ... and
Helix Strand

Motifs: β beta turn γ gamma turn α alpha helix

Figure S2. Schematic representation of secondary structure prediction of spike of SARS-CoV-2 (left), bat SL-CoV (middle) and SARS-CoV (right) based on the consensus sequences. The secondary structure of SARS-CoV-2 spike contains 17 sheets, 18 beta hair pins, 18 beta bulges, 53 strands, 20 helices, 23 helix-helix interacts, 209 beta turns, 73 gamma turns and 14 disulphides. Bat SL-CoV spike contains 12 sheets, 1 beta alpha beta unit, 18 beta hair pins, 15 beta bulges, 48 strands, 22 helices, 22 helix-helix interacts, 106 beta turns, 15 gamma turns and 6 disulphides. SARS-CoV spike contains 17 sheets, 18 beta hairpins, 19 beta bulges, 48 strands, 26 helices, 20 helix-helix interacts, 183 beta turns, 60 gamma turns, 14 disulphides.

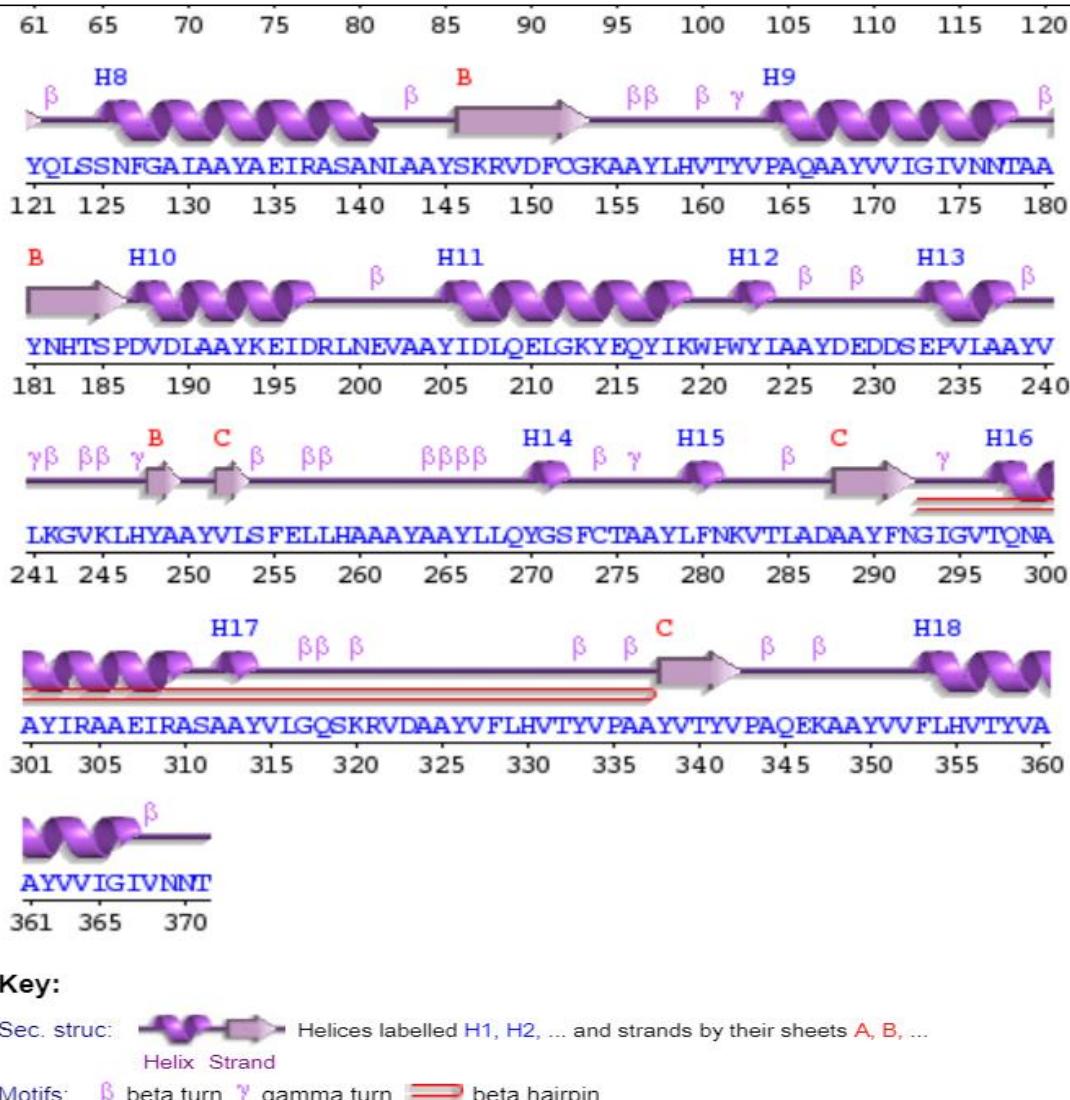

Figure S3. Schematic representation of secondary structure prediction of the multi-epitope vaccine construct. It possesses three sheets, three beta alpha beta units, two beta hairpin, one beta buldge, nine strands, 18 helices, 14 helix-helix interacts, 37 beta turn, 13 gamma turns
