
Supplementary figure

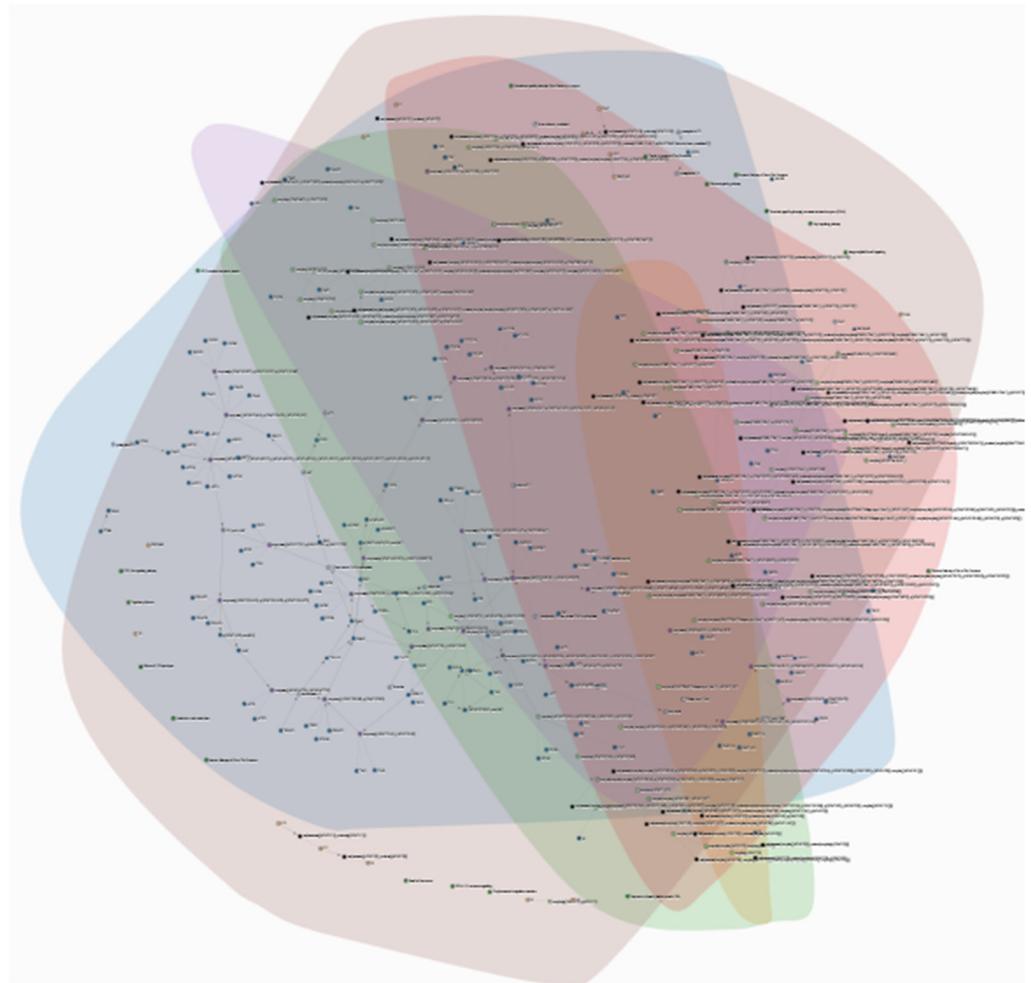

Figure S1. Overview of the extracted knowledge from the common pathway databases, involving pathways of platelet activation and of the coagulation cascade. The following pathways are included: HSA04611 (blue, “platelet activation”, KEGG), R-HAS-140834 (orange, “extrinsic pathway of fibrin clot formation”, Reactome), R-HSA-140837 (green, “intrinsic pathway of fibrin clot formation”, Reactome), R-HSA-140875 (red, “common pathway of fibrin clot formation”, Reactome), R-HSA-76009 (purple, “platelet aggregation/plug formation”, Reactome) and WP272 (brown, “blood clotting cascade”, WikiPathways).

Supplementary table

Table S1. Evidence for heme relations in the platelet activation signaling pathways from additional literature screening.

Relation	Evidence	PMID
"AA" and "heme"	Interaction of arachidonic acid and heme iron in the synthesis of prostaglandins.	6770594
"Src" and "heme"	We found that heme indeed affects the phosphorylation of key tyrosine residues in Jak2 and Src , and is therefore able to modulate Jak2 and Src activity.	21036157
"ERK" and "heme"	The ratio of phospho- ERK : ERK total was weakly modified by the injection of heme in WT mice (...). (...) heme induces Akt phosphorylation and ERK-2 nuclear translocation in neutrophils.	33314778, 15265937
"FcR γ " and "heme"	Heme , a novel endogenous ligand shared by CLEC-2 and GPVI/ FcRγ , activates human and murine platelets.	33843987
"myosin" and "heme"	Oxidation of sulfhydryl (SH) groups was detected in structural proteins (e.g., nebulin, α -actinin, meromyosin 2) and in contractile proteins (e.g., myosin heavy chain and myosin-binding protein C) as well as in titin in the presence of 300 μ M heme .	33142923
"PI3K" and "heme"	Inhibition of ERK and PI3K pathways abolished heme -protective effects upon human neutrophils, suggesting the involvement of the Ras/Raf/MAPK and PI3K pathway on this effect.	15265937
