

Supplementary Materials: Atomic Layer Deposition of Pt Nanoparticles within the Cages of MIL-101: A Mild and Recyclable Hydrogenation Catalyst

Karen Leus ^{1,*}, Jolien Dendooven ², Norini Tahir ¹, Ranjith K Ramachandran ², Maria Meledina ³, Stuart Turner ³, Gustaaf Van Tendeloo ³, Jan L. Goeman ⁴, Johan Van der Eycken ⁴, Christophe Detavernier ² and Pascal Van Der Voort ^{1,*}

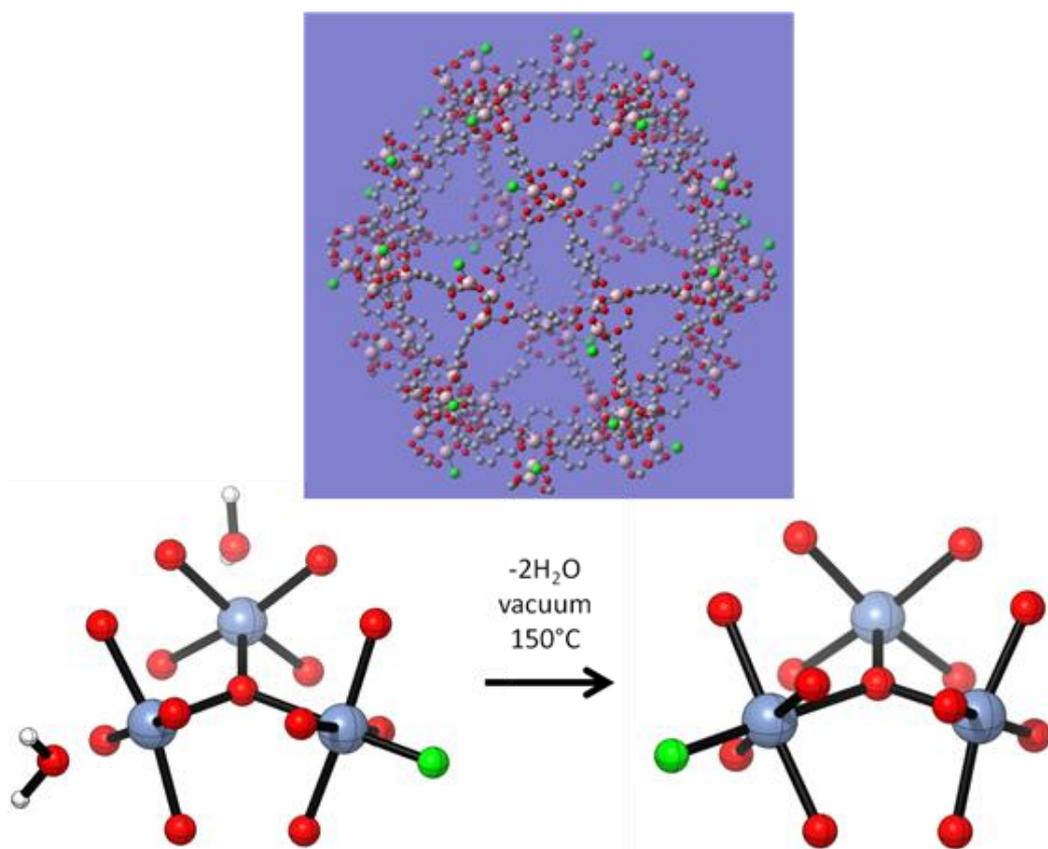

Figure S1. Schematic structure of a MIL-101 cage (**top**) and formation of coordinatively unsaturated sites after the removal of the terminal water molecules (**bottom**). (MIL = Materials Institute Lavoisier).

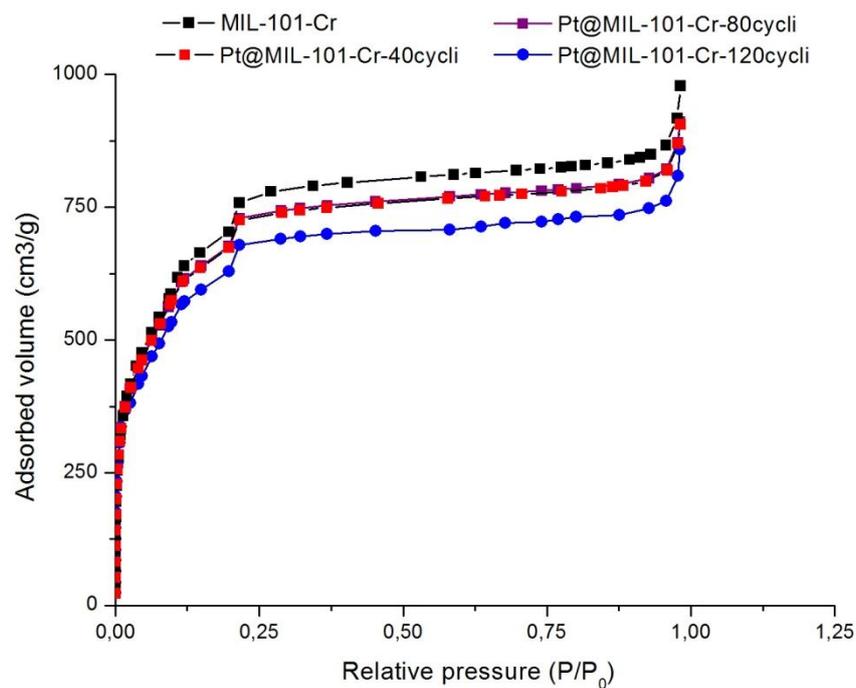

Figure S2. Nitrogen adsorption isotherms for MIL-101-Cr and the Pt@MIL-101-Cr obtained after respectively 40, 80 and 120 atomic layer deposition (ALD) cycles.

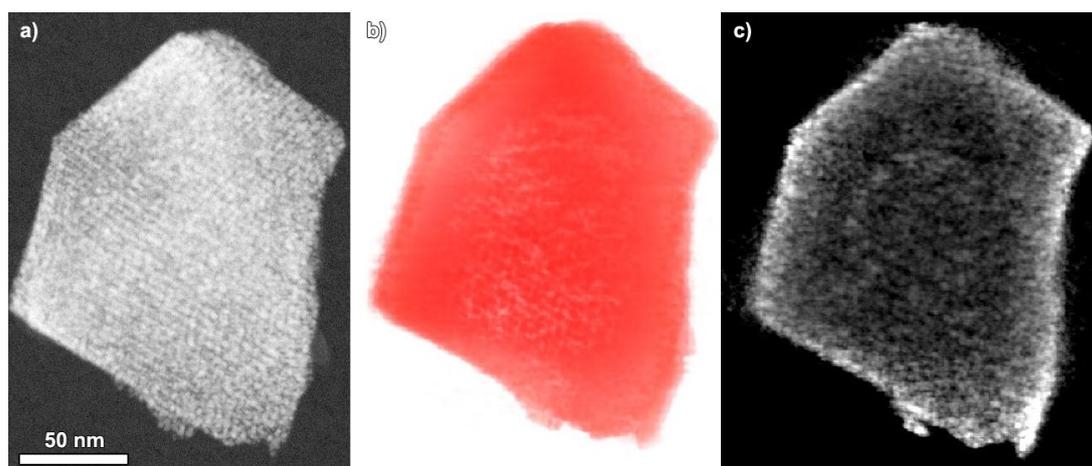

Figure S3. (a) (high angle) annular dark field scanning transmission electron microscopy measurements ((HA)ADF-STEM) image of a MIL-101 particle heavily loaded with Pt nanoparticles; (b) tomographic volume reconstruction of the same Pt@MIL-101 crystal and (c) orthoslice through the reconstruction.

See also uploaded movie.

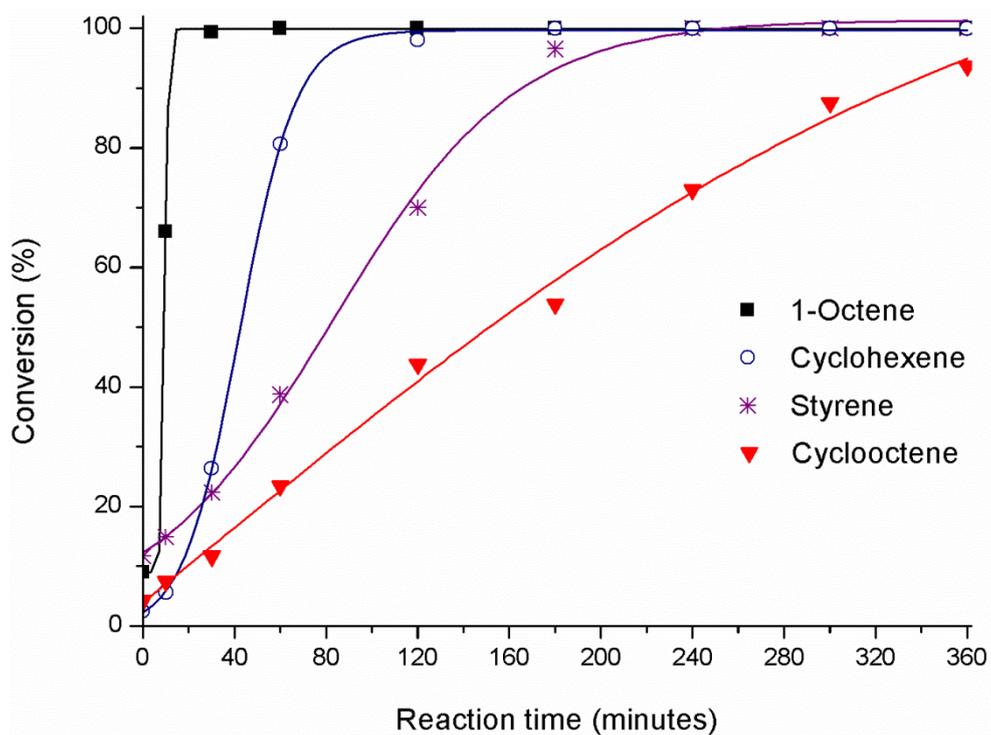

Figure S4. Conversion patterns using Pt@MIL-101-Cr-120 cycles as a catalyst and 1-octene (**black**), cyclohexene (**blue**), styrene (**purple**) or cyclooctene (**red**) as the substrate. Reaction conditions: 25 mmol of substrate, 0.05 mmol of catalyst, room temperature, 6 bar of H₂.

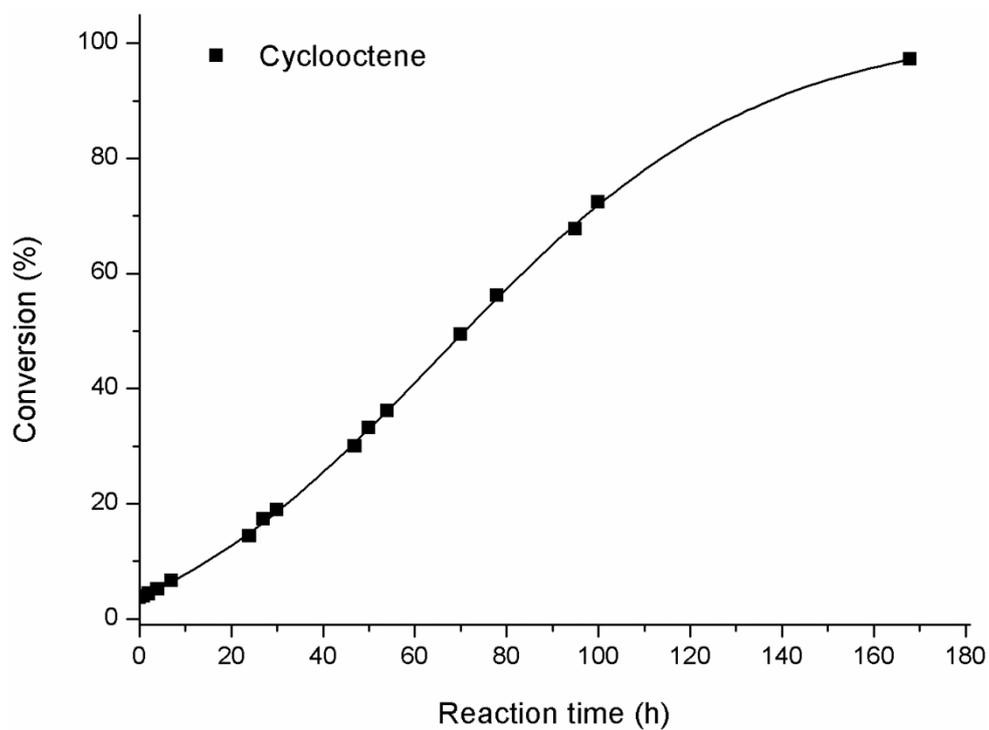

Figure S5. Concentrated run using Pt@MIL-101-Cr-120 cycles as a catalyst and cyclooctene as the substrate. Reaction conditions: 250 mmol of cyclooctene, 0.05 mmol of catalyst, room temperature (RT), 6 bar of H₂.

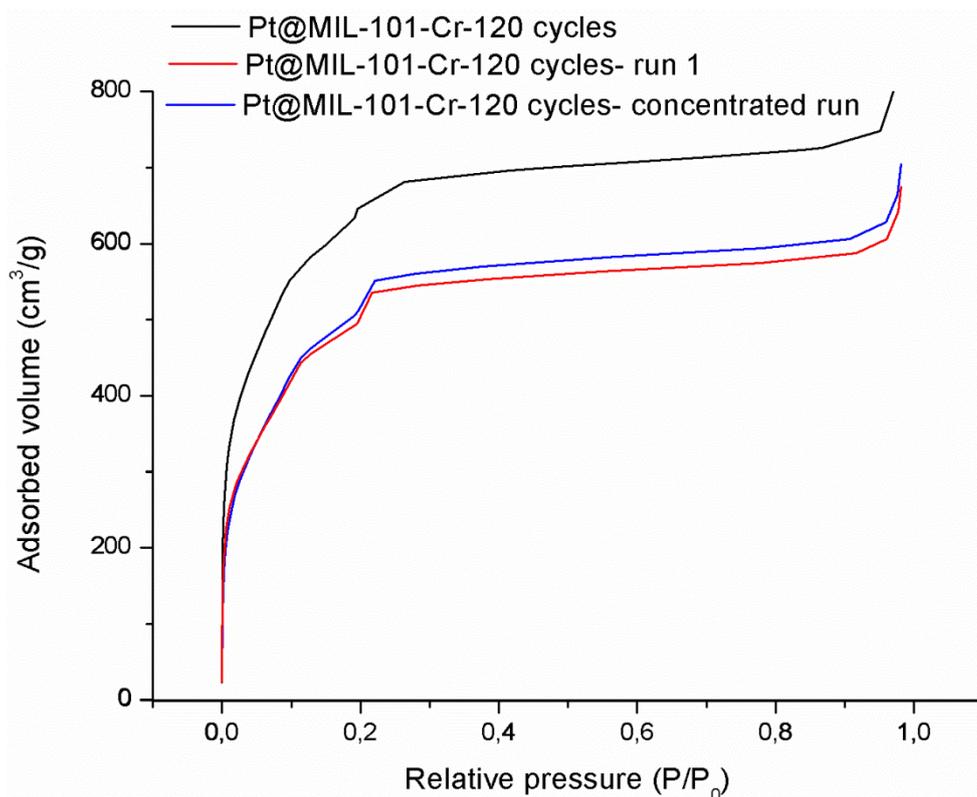

Figure S6. Nitrogen adsorption isotherms of Pt@MIL-101-Cr-120 cycles before (**black**) and after the first catalytic run (**red**) and the concentrated catalytic test (**blue**).
