

Control of Membrane Fouling in Organics Filtration Using Ce-Doped Zirconia and Visible Light

Figure S1. XRD patterns of pure and Ce-doped ZrO_2 prepared by hydrothermal and sol-gel processes. Triangles and squares on top of the patterns indicate the peaks of monoclinic (m-ZrO_2 , ICSD #658755) and tetragonal (t-ZrO_2 , ICSD #66781) phases, respectively.

Figure S2. FTIR spectra of Ce-ZrO_2 samples prepared by hydrothermal (HYD) and sol-gel (SG) processes. FTIR spectra were registered in transmission mode using a Bruker Vector 22 spectrophotometer equipped with Global source, DTGS detector, and working with 128 scans at 4 cm^{-1} resolution in the 4000–400 cm^{-1} range. Samples were analyzed as self-supporting pellets by dispersing the samples in KBr (1:20 weight ratio).

Figure S3. (a) UV-Vis-DRS spectra of pure and Ce-doped ZrO₂ prepared by hydrothermal and sol-gel processes, (b) magnification of region 200–500 nm.

Figure S4. Linear fitting of Langmuir isotherm equation to experimental data of HA absorption on Ce-ZrO₂ samples prepared by hydrothermal (HYD) and sol-gel (SG) processes.

Figure S5. Determination of the pseudo-first-order kinetic rate constants, K_{obs} , for (a) Ce-ZrO₂-HYD and (b) Ce-ZrO₂-SG.

Figure S6. Determination of the Langmuir-Hinshelwood model parameters for Ce-ZrO₂ samples prepared by hydrothermal (HYD) and sol-gel (SG) processes.
