Supplementary Material Description: The supplementary material summarizes the main results obtained in proteomics and metabolomics-based studies on glaucoma biomarkers, with specificity to eye tissue or fluid as well the analytical approach and the identified altered molecules. The fold-change, when possible, has been also determined. Table S1 illustrates the candidate markers observed in the analysis of aqueous humor samples from glaucoma patients. Table S2 contains the list altered molecules identified in retina, optic nerve, vitreous body or trabecular meshwork from glaucoma patients. Table S3 shows the list of proteins or metabolites obtained during the analysis of tear samples from patients with glaucoma. Table S4 recapitulates the candidate glaucoma biomarkers identified in blood, serum or plasma (in addition to other fluid).
