

Supplementary Material File S1

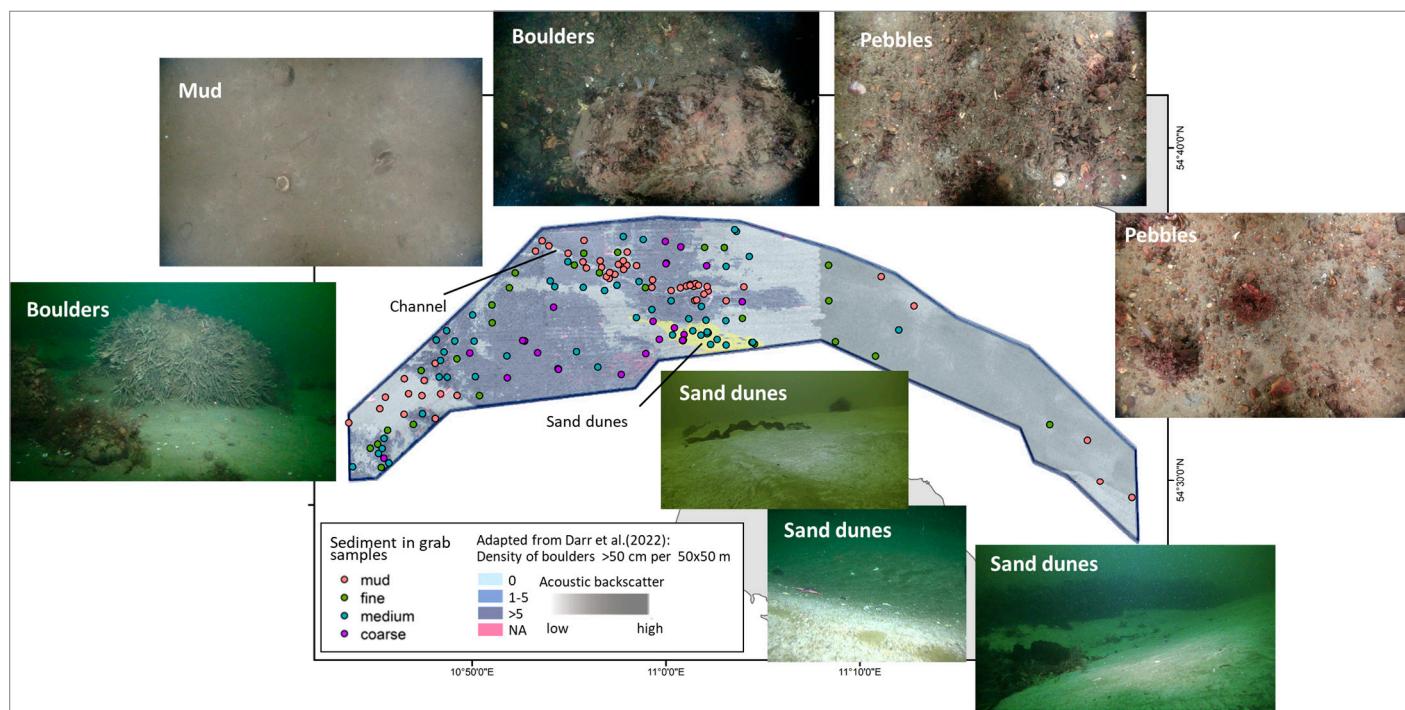

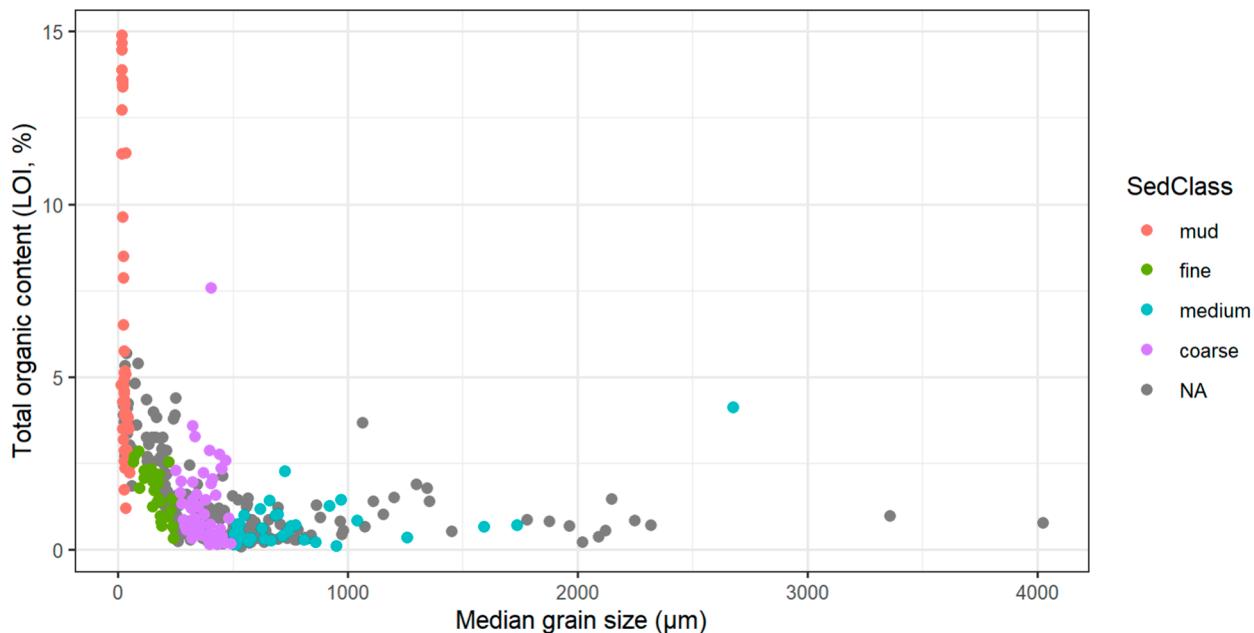

Figure S1. Description of the occurring substrates at the study site. Sediment median grain size based on granulometry analysis (for the resulting assignment to one of 4 sediment type classes considered in this study refer to Figure 1 in the main text). The thresholds used to separate between the sediment types were (i) muddy substrate (median grain size $d_{50} < 63 \mu\text{m}$), (ii) fine sand ($d_{50} 63-250 \mu\text{m}$), (iii) medium sand ($d_{50} 250-500 \mu\text{m}$) and (iv) coarse sand and gravel ($d_{50} > 500 \mu\text{m}$). NA indicates stations excluded from the analysis if the assignment to sediment type based on median grain size showed substantial mismatch with on-board optical description of sediment in the grab(s) collected for infauna. Values of median grain size are plotted against the total organic content estimated from the sediment sample using loss on ignition (LOI). Map with exemplary figures provides an overview with backscatter mosaic and boulder density layers adapted from Darr et al. (2022), location of sand dunes (in yellow), channel (visible from backscatter) and few photos to provide reader with the impression on mud habitat, sand dunes, pebbles and boulders around the study area.

Explanatory Text S1: Testing the suitability of Poisson distribution.

We have tested if the number of species (Nsp) follows normal or Poisson distribution using Shapiro-Wilk normality test. If the significance value of the Shapiro-Wilk test is greater than 0.05, normal distribution can be assumed for the data. If it is below 0.05, the data significantly deviate from a normal distribution. Number of species (Nsp) do not follow normal distribution:

Shapiro-Wilk normality test: $W = 0.95837$, p-value = 0.00009

Wilcoxon rank sum test with continuity correction comparing generated data with Poisson distribution and the same parameter $\lambda = 30.4$, same as mean species number in our data set:

W = 12338, p-value = 0.3521

At the 5% significance level, the null hypothesis that two samples come from the same distribution cannot be rejected, and we can assume our variable of interest to the Poisson distribution.

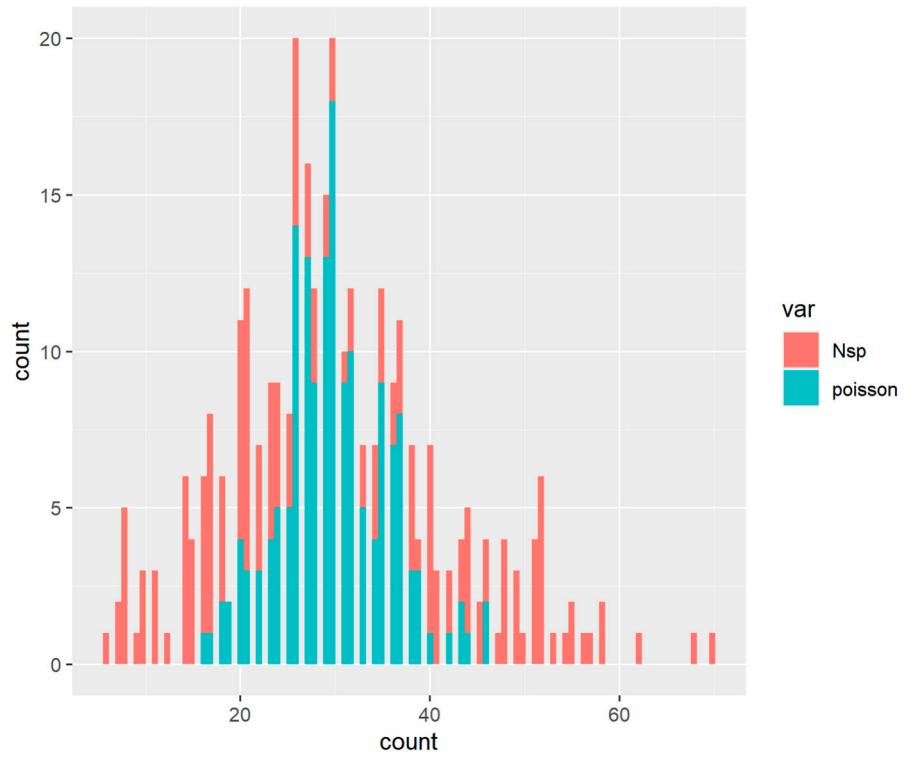

Figure S2. Poisson distribution.

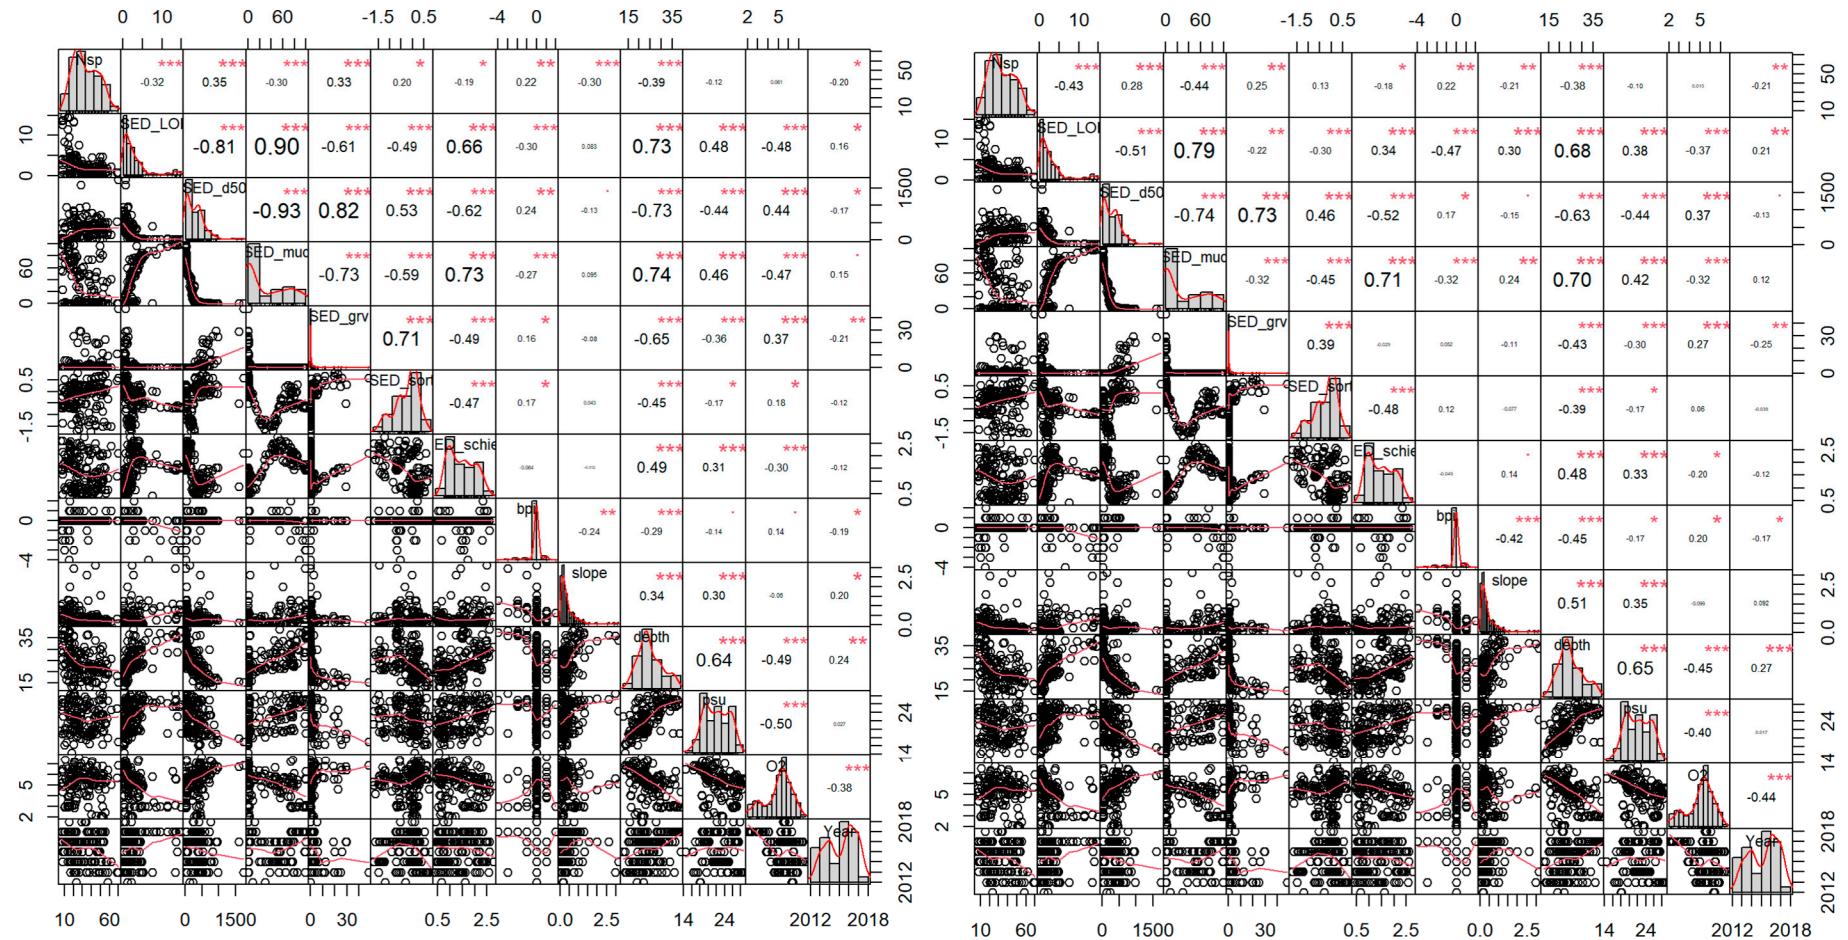

Figure S3. Checking predictors for collinearity. Left plot: Spearman; right plot: Pearson.

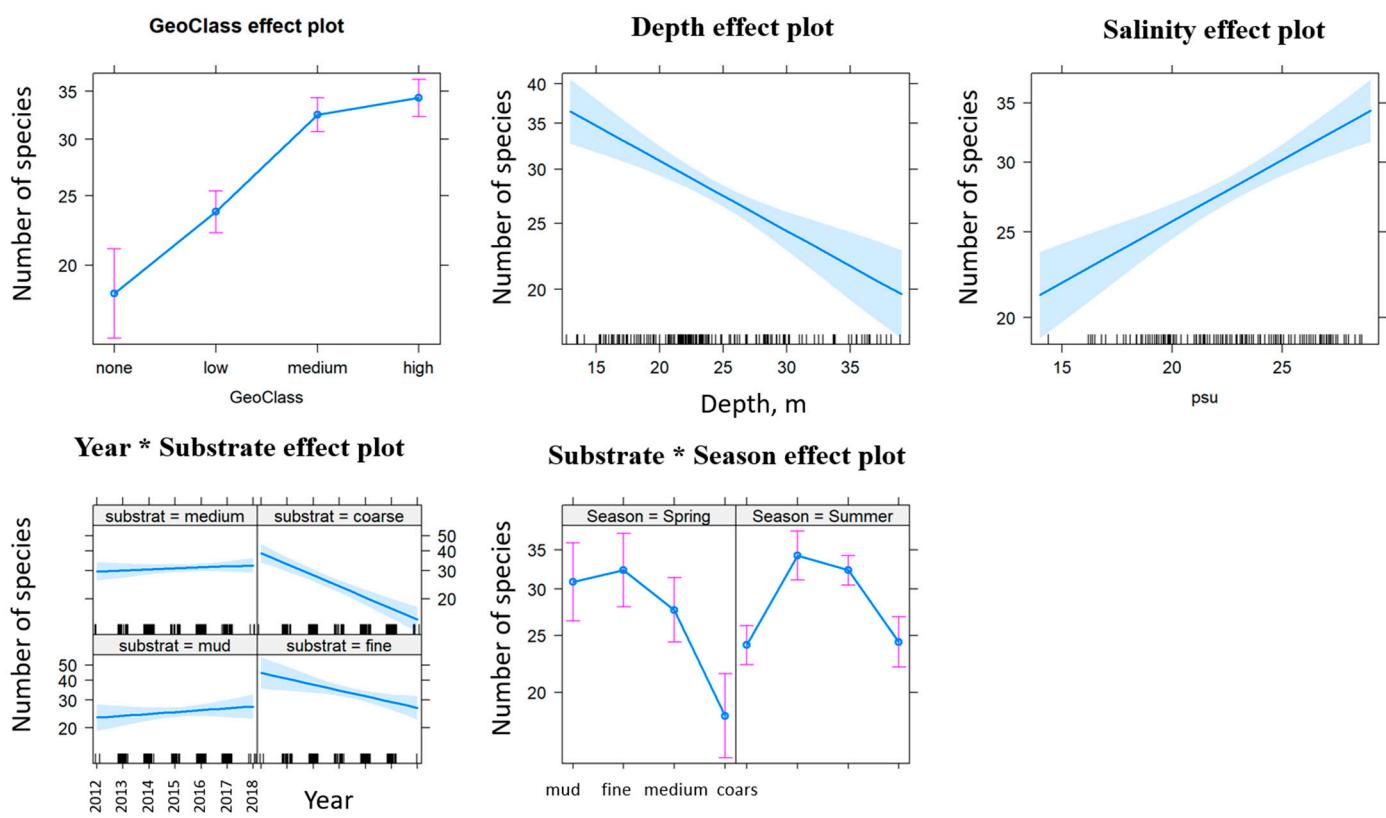

Figure S4. Effect plots for each predictor in the Poisson model (overdispersed).

Explanatory Text S2: Dispersion analysis and evaluation of how much the coefficient estimations are affected by overdispersion.

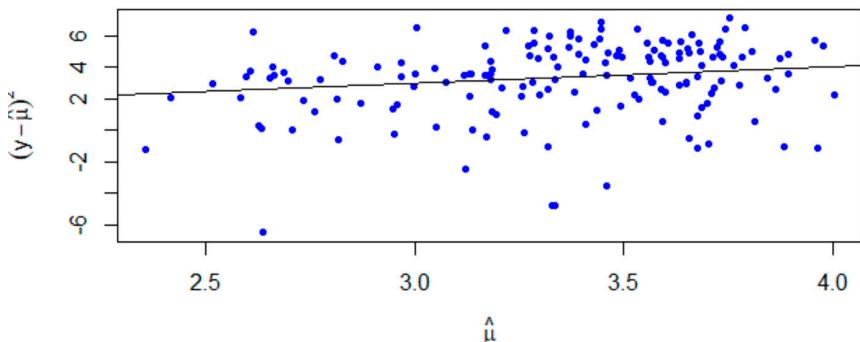

Figure S5. Plot of estimated variance against the mean (Pearson residuals) for the best fitted Poisson model.

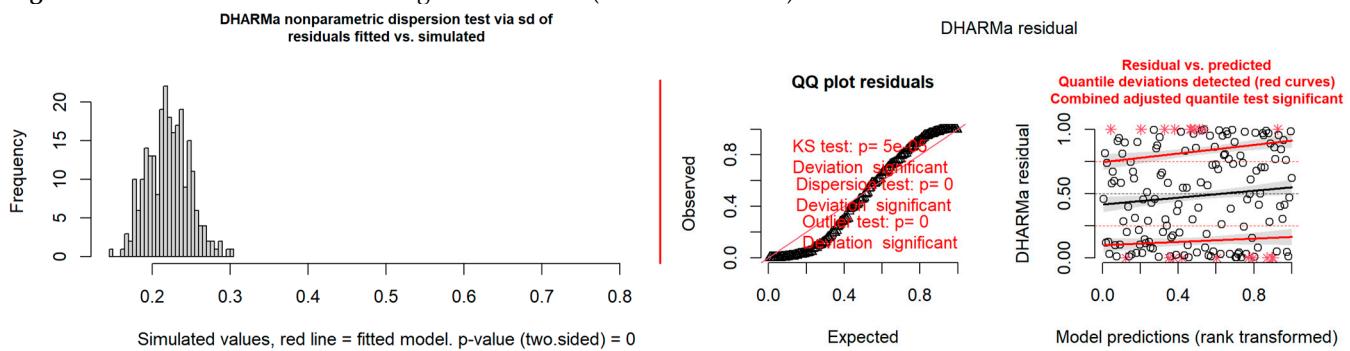

Figure S6. DHARMA nonparametric dispersion test via sd of residuals fitted vs. simulated for the best fitted Poisson model: (dispersion = 3.8552, p-value < 0.0001) and plots of scaled residuals.

To adjust for overdispersion we estimated the dispersion parameter within the model using the *Quasipoisson* family and alternatively used **Negative Binomial** instead of the Poisson model. Both model results are summarized below:

Table S2. Results of GLM using the *Quasipoisson* family and alternatively used Negative Binomial instead of the Poisson model.

	using quasi-family to estimate the dispersion					assuming negative binomial distribution

Most of predictors' coefficients remained significant regardless of assuming Quasipoisson or negative binomial distribution, though some lost in significance level comparing to GLM model fitted using Poisson distribution. The exception was factor Season that became insignificant outside of the interaction with mud in case of both adjusted models. This caused little change in the interpretation of the model.

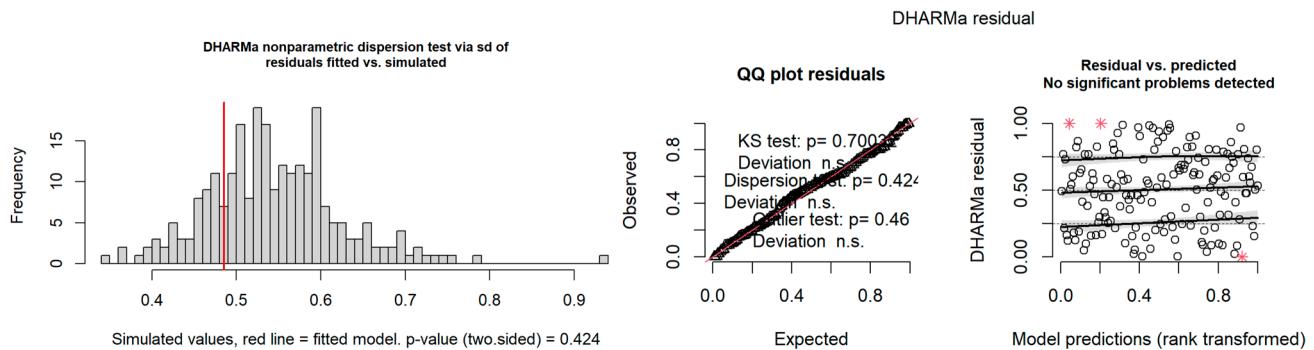

Figure S7. DHARMA nonparametric dispersion test via sd of residuals fitted vs. simulated for negative binomial model (dispersion = 0.88992, p-value = 0.424) and plots of scaled residuals.

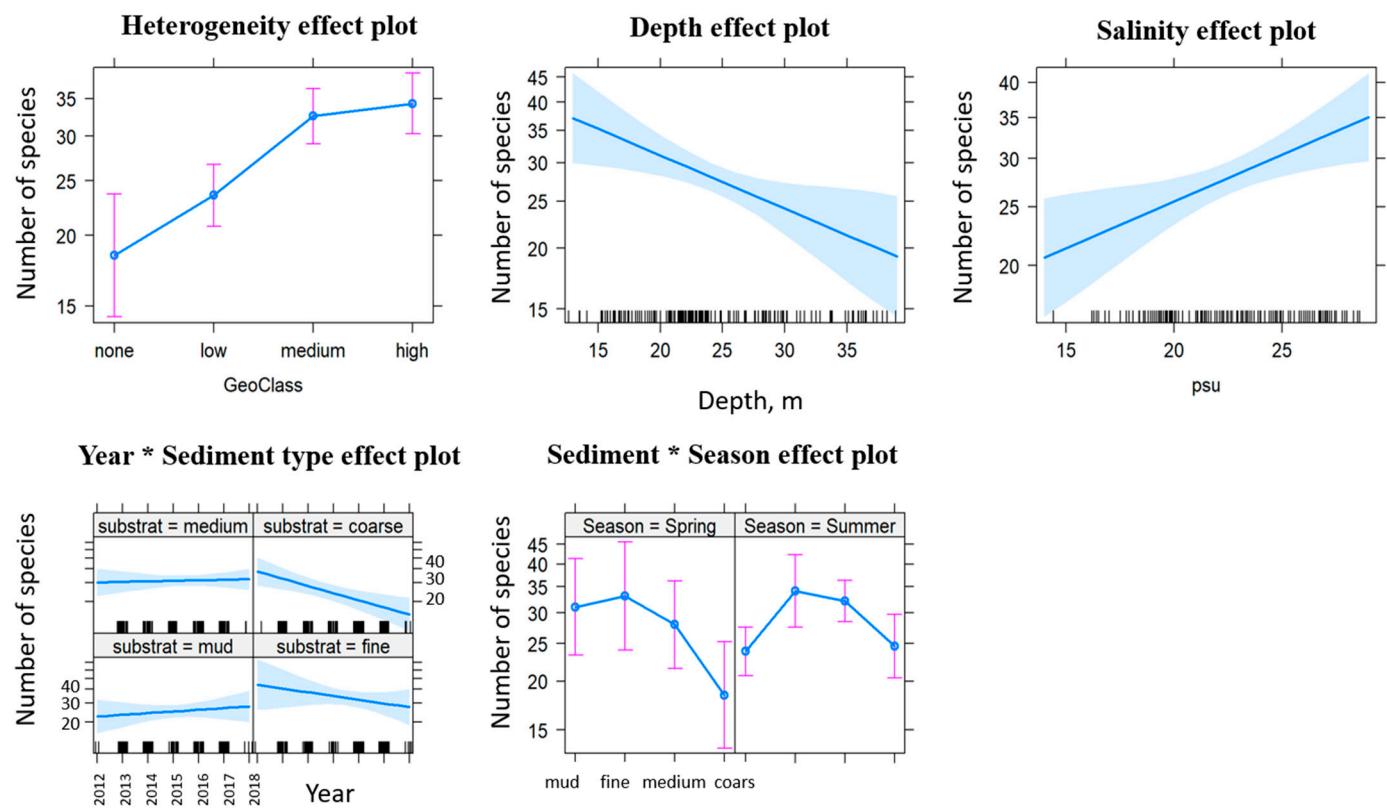

Figure S8: Effect plots for each predictor in the final negative binomial model remained very similar.

Results of post-hoc tests for the final negative binomial GLM model. Upper triangle: P values adjust = "tukey"; diagonal: [Estimates] (emmean); lower triangle: Comparisons (estimate) earlier vs. later.

Table S3. Row and column labels: GeoClass
