

Role of Rhodopsins as Circadian Photoreceptors in the *Drosophila melanogaster*

Pingkalai R. Senthilan, Rudi Grebler, Nils Reinhard, Dirk Rieger, and Charlotte Helfrich-Förster

To find out *Drosophila* proteins that could be identified by Rh7 antibodies used in Ni et al. [20], and Kistenpfennig et al. [19], we used a BLASTP search (<https://blast.ncbi.nlm.nih.gov/Blast.cgi>) for short input sequences (expect threshold: 200,000, word size: 2, matrix: PAM30, gap costs: existence: 9 extension: 1, no adjustment, taxid: 7227). For the search, we used the epitope sequence aa86 to aa110, for the Kistenpfennig et al. [19] antibody, and the epitope sequence aa1 to aa80, for the Ni et al., [20] antibody. We restricted the search to the first 250 similar protein sequences for both epitopes and looked for common proteins in both searches. We found three proteins: Rh7, Msp300, and CG6424 that could be detected by both antibodies (indicated in red). One should consider that the antibody used in Ni et al., [20] was raised against the GST-fused Rh7 [aa1-aa80] peptide. Taking the entire GST-Rh7 epitope in account, may lead to even less-specific binding sites.

Table S1. TOP 250 Proteins that could be detected by the peptide antibody (against aa86-110) used in Kistenpfennig et al. [19]).

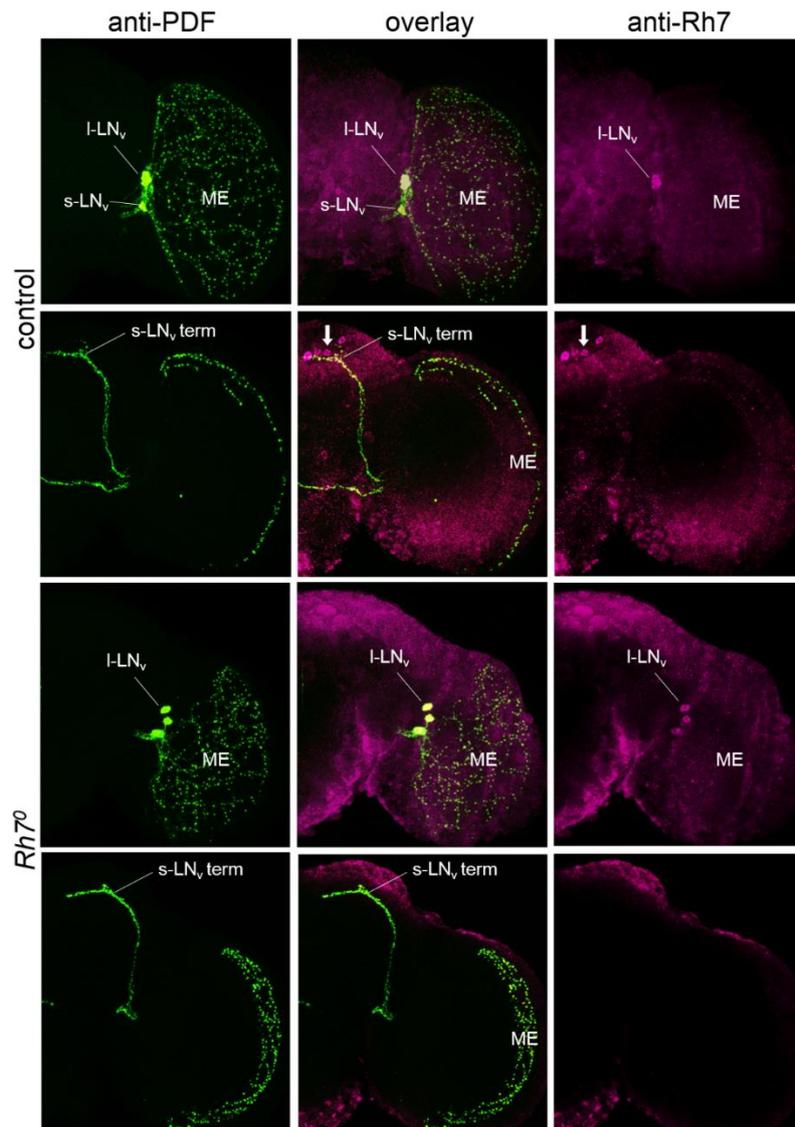

Figure S1. PDF and Rh7 labelling in the right brain hemispheres of a control fly and an *Rh7⁰* mutant. For each fly, the upper row shows the overlay of thirty anterior confocal sections (2µm thick) and the lower row shows thirty posterior sections. Rh7-labeling is present in the large PDF neurons (1-LN_v) of the control and the *Rh7⁰* fly. In the control fly, Rh7-labeling is additionally present in the neurons (white arrows), in the dorsal brain close to the terminals of the small PDF neurons (s-LN_v term). ME medulla.
