Table S1. Unique metabolites identified in brain extracts. Compound names, chemical formulae, method of detection, metabolomics standards initiative (MSI) level of identification and chemical taxonomy (class and sub-class) are given for each. In the case where a metabolite was detected by more than one method, the most representative method for that compound was chosen for reporting and statistical analysis.

Figure S1. OPLS score plot of the model constructed for the five studied groups. Infected mice (G4) are colored in red and controls (G5) are colored in green. The three treatment groups are shown in dark blue (G1), in blue (G2) and in light blue (G3).

Figure S2. Metabolic pathways highlighted by MetaboAnalyst 5.0 to have been affected by CDI based on the differentiated metabolites in brain. The x-axis represents the values of pathway impact extracted from the pathway topological analysis. The y-axis represents the $-\log$ of the p -value derived from the pathway enrichment analysis. The pathways with higher scores of both values were illustrated on top right region of the contracted plot.
