

**Supplementary Material**  
**Table of Contents**

**Table S1:** Precision of glycosylation profiling (all analytes).

**Table S2:** Differences in median CVs (Analytes above 1% relative abundance).

**Figure S1:** Profile comparability PharmEPO.

**Figure S2:** Profile comparability Eprex.

**Table S3:** Fingerprinting resolution.

**Table S4:** Eprex relative glycan abundances by composition.

The effect of reducing the number of analytes to only those above 1% relative abundance is apparent when comparing Table 1 to Table S1. As expected, all methods show a lower median CV for the abundant analytes than for all analytes.

**Table S1.** Precision of glycosylation profiling. Descriptive statistics for the distribution of CVs of all analytes.

Discoveries highlighted in bold green.

Differences in median CVs. were tested with a Kruskal-Wallis test with multiple comparisons. Multiple testing correction was applied using a 5% FDR and the Benjamini-Hochberg method. Only analytes above 1% relative abundance were considered.

#HILIC–FLD(2AB)/WAX does not distinguish the number of O-acetylations present

\*This/these methods do not differentiate NeuAc and NeuGc

\*\*The abundance of H6N5F1S3/FA3G3S3 is far lower in the HILIC methods than in MALDI-MS. For the HILIC-FLD(2AB)/WAX this is easily explained by the lack of detection of the O-acetylated variants. However, for HILIC-FLD(PROC)-MS the abundance is lower in all related species.

nd: not detected .
