**Figure S1.** Superposition of the EDA-AHR docking pose with the clusters obtained from the molecular dynamics of EDA with AHR. Docking pose (green), cluster 1 (cyan), cluster 2 (magenta), cluster 3 (yellow), 4 (salmon), 5 (white), 6 (purple), 7 (orange), 8 (light green), 9 (forest), and 10 (hot pink).

**Figure S2.** EDA-induced expression of a xenobiotic responsive element (XRE)-driven reporter gene. A. Schematic picture showing the reporter cassette containing three XREs upstream of the EGFP coding sequence, which was used for *in vivo* testing. B. Representative fluorescent microscopy images, showing the transient expression of the reporter cassette in 2 dpf zebrafish larvae. Note that EDA treatment was able to induce reporter expression (fluorescent dots). All images are lateral views, with anterior to the left. \*\* $p < 0.01$  with unpaired Student's *t*-test.

Figure S3. EDA treatment increases Olig2 protein levels in fish larvae. Representative Western Blot for Olig2 in control and EDA-treated fish larvae lysates. The bar-graph depicts the quantification of detected Olig2 protein levels normalized to beta-actin. Data are expressed as the mean  $\pm$ SEM of 3 biological replicates (10 larvae per replicate). \* $p < 0.05$  with unpaired Student's *t*-test. The image was edited using BioRender.com.

**Figure S4.** Overlapping poses of the docking of GNF-351 with AHR. In green the pose resulting from docking with Autodock 4, in cyan the pose resulting from docking with Glide.

**Figure S5.** 2D representation of the bonds above 30% that GNF-351 makes with AHR during the 500 ns of molecular dynamics.

**Figure S6.** Superimposing docking results and molecular dynamics of GNF-351 with AHR. In green the pose resulting from docking with Autodock 4, in cyan the pose resulting from docking with Glide, in magenta the cluster number 1 resulting from molecular dynamics simulation.
