

# Supplementary Materials: Knockdown of WHIRLY1 Affects Drought Stress-Induced Leaf Senescence and Histone Modifications of the Senescence-Associated Gene *HvS40*

Bianka Janack, Paula Sosoi, Karin Krupinska and Klaus Humberg

**Figure S1.** Alterations of histone modification levels (% of input) at *HvS40*. Alterations of histone modification levels at *HvS40* during drought stress-induced senescence of barley primary leaf. Drought stress-specific alterations (% of inputs) in the level of histone 3 modifications K9me2 and K9ac at *HvS40* (promoter (I-III), TLS (IV) and open reading frame (V and VI)) shown as boxplots (central bar marking the median, lower and upper limits of the box marking the 25th and 75th percentiles, and the whiskers extending the 1.5 interquartile range from the box; data not included between the whiskers are dotted as outliers (white dots) and extremes (black dots)). WT control (blue), WT drought stress (light blue), RNAi-W1 control (green), RNAi-W1 drought stress (light green). Asterisks indicate statistically significant differences between control and drought stress (paired Student's t-test p values, \*  $p < 0.05$ ; \*\*  $p < 0.01$ ; \*\*\*  $p < 0.001$ ). Each data point represents the average of at least three biological replicates.

**Table S1.** Oligonucleotide sequences of expression and ChIP analyses.
