

Supplementary Materials

A

B

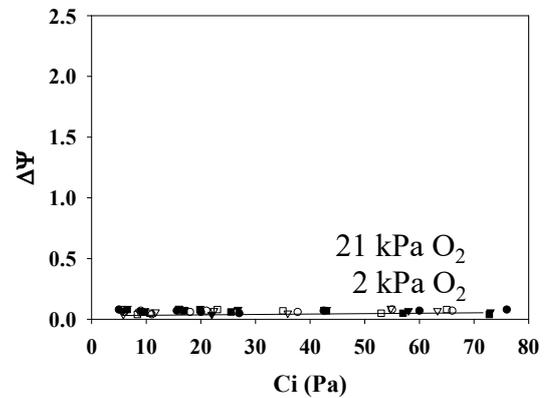

Figure S1. Both ΔpH and $\Delta\Psi$ which contribute to proton motive force (pmf), reflected as the total electrochromic shift (ECS) signal, were separately determined with ECS in Figure 3 following the method of Cruz et al. (2001). Please see the details in the text. (A), ΔpH ; (B) $\Delta\Psi$. Closed circle, 21 kPa O_2 ; Open circle, 2 kPa O_2 . Data were from three independent experiments using leaves attached to three wheat plants (N = 3: sample 1, circle; 2, square; 3, triangle). The ambient partial pressures of CO_2 were changed from 100 to 5 through 80, 60, 40, 30, 20, and 10 Pa at 21 and 2 kPa O_2 , for the same leaves. Lines in the graphs were arbitrarily drawn to indicate the trends of the data.

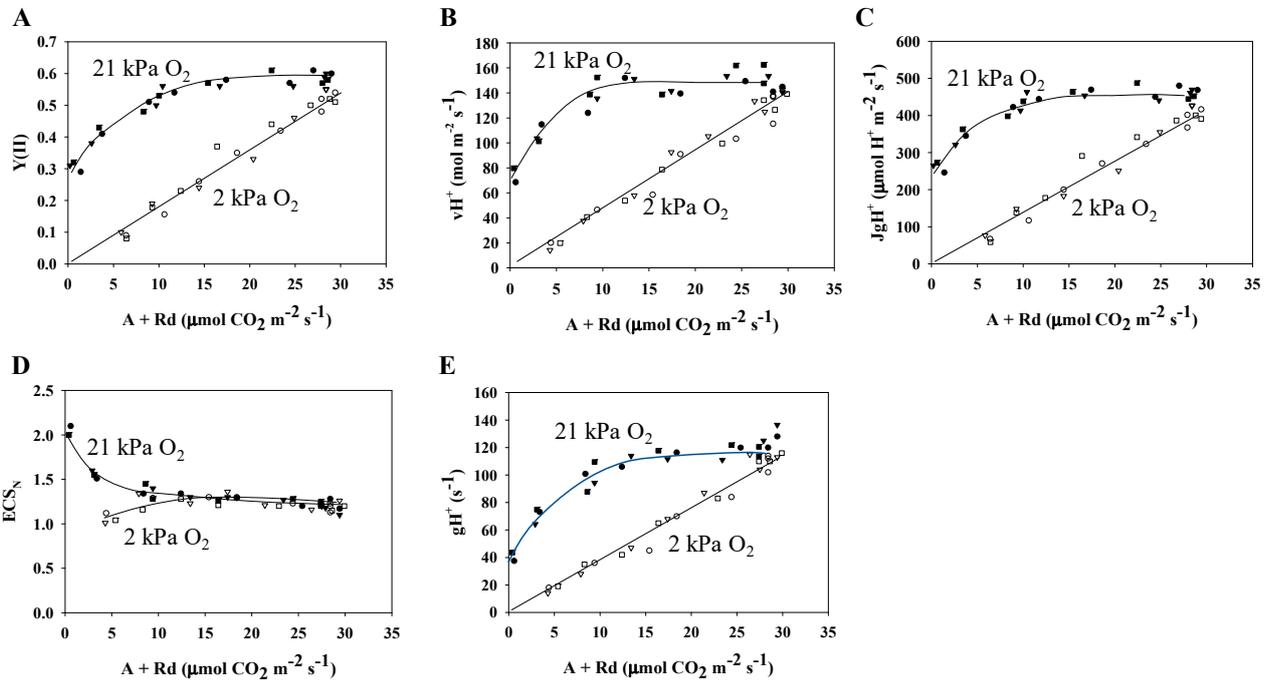

Figure S2. Relationships of $Y(II)$, vH^+ , JgH^+ , ECS_s , and gH^+ with $(A + Rd)$. The data for $Y(II)$ and $(A + Rd)$ were from Figures 1 and 2, and JgH^+ was calculated from the data in Figure 1 by the method, described in the “Materials and Methods”. The data for ECS_s , vH^+ , gH^+ , and $(A + Rd)$ were from Figure 3. (A) $Y(II)$ was plotted against $(A + Rd)$. (B) vH^+ was plotted against $(A + Rd)$. (C) JgH^+ was plotted against $(A + Rd)$. (D) ECS_s was plotted against $(A + Rd)$. (E) gH^+ was plotted against $(A + Rd)$. Data were from three independent experiments using leaves attached to three wheat plants ($N = 3$: sample 1, circle; 2, square; 3, triangle). The ambient partial pressures of CO_2 were changed from 100 to 5 through 80, 60, 40, 30, 20, and 10 Pa at the two $p\text{O}_2$ conditions (closed symbols, 21 kPa; open symbols, 2 kPa), for the same leaves. Lines in the graphs were arbitrarily drawn to indicate the trends of the data.

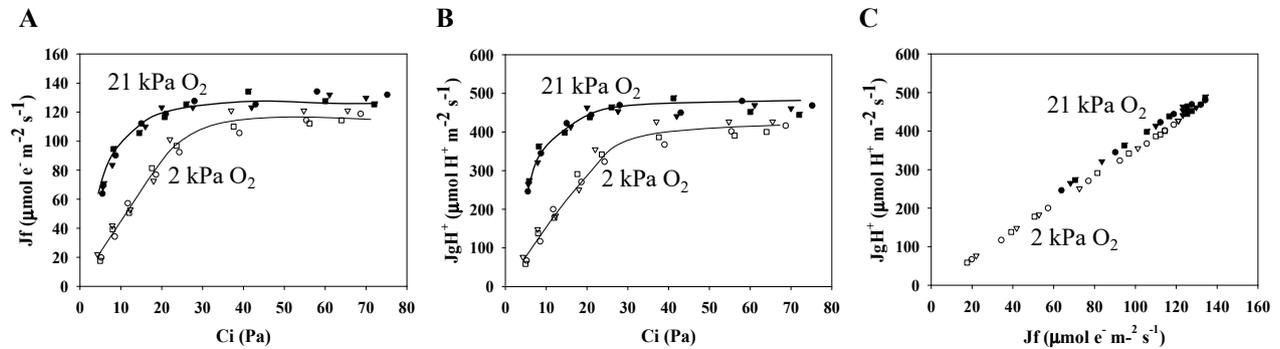

Figure S3. Dependence of J_f and J_gH⁺ on C_i, and the relationship between J_gH⁺ and J_f. The electron flux in photosynthetic linear electron flow (J_f), reflected as the electron flux in PSII [Y(II)], was calculated as $\alpha \times Y(II) \times \text{PFD}$ (please see the detail in “Materials and Methods”). The data for Y(II) and J_gH⁺ were from Figure 1. (A) J_f was plotted against C_i. (B) J_gH⁺ was plotted against C_i. (C) J_gH⁺ was plotted against J_f, both of which were from Supplementary Figures 3A and 3B. Data were from three independent experiments using leaves attached to three wheat plants (N = 3: sample 1, circle; 2, square; 3, triangle). The ambient partial pressures of CO₂ were changed from 100 to 5 through 80, 60, 40, 30, 20, and 10 Pa at 21 (closed symbols) and 2 kPa O₂ (open symbols), for the same leaves. Lines in the graphs were arbitrarily drawn to indicate the trends of the data.
