Supplemental Material

Table S1. List of the selected 71 weather stations (WS) in mainland Portugal. Their codes, name, latitude, longitude, and elevation (meters above mean sea level) are shown. The start and end years of the available data by weather station are also listed (end years for currently operational stations are indicated by -). The corresponding percentages of missing data in the 10-minute precipitation over the recording period are also provided. Stations with surface pressure records are highlighted in their codes with *. Data source: IPMA.

Code	Weather station name	Latitude (°N)	Longitude (°W)	Elevation (m AMSL)	Start year	End year	Missing data (%)
531*	Cabo Carvoeiro	39.361	9.406	32	2000	-	81
533*	Sagres	37.012	8.949	25	2000	-	73
535*	Lisboa Geofísico	38.719	9.149	77	2009	2014	5
541*	Sines Monte	37.954	8.838	103	2000	2006	1
542*	Sines Cabo	37.957	8.887	19	2000	-	85
543*	Viana do Castelo	41.706	8.802	16	2009	-	71
545*	Porto Pedras Rubras	41.233	8.681	63	2000	-	5
546*	Porto Serra Pilar	41.138	8.602	93	2006	-	72
548*	Coimbra Aeródromo	40.156	8.467	170	2000	-	2

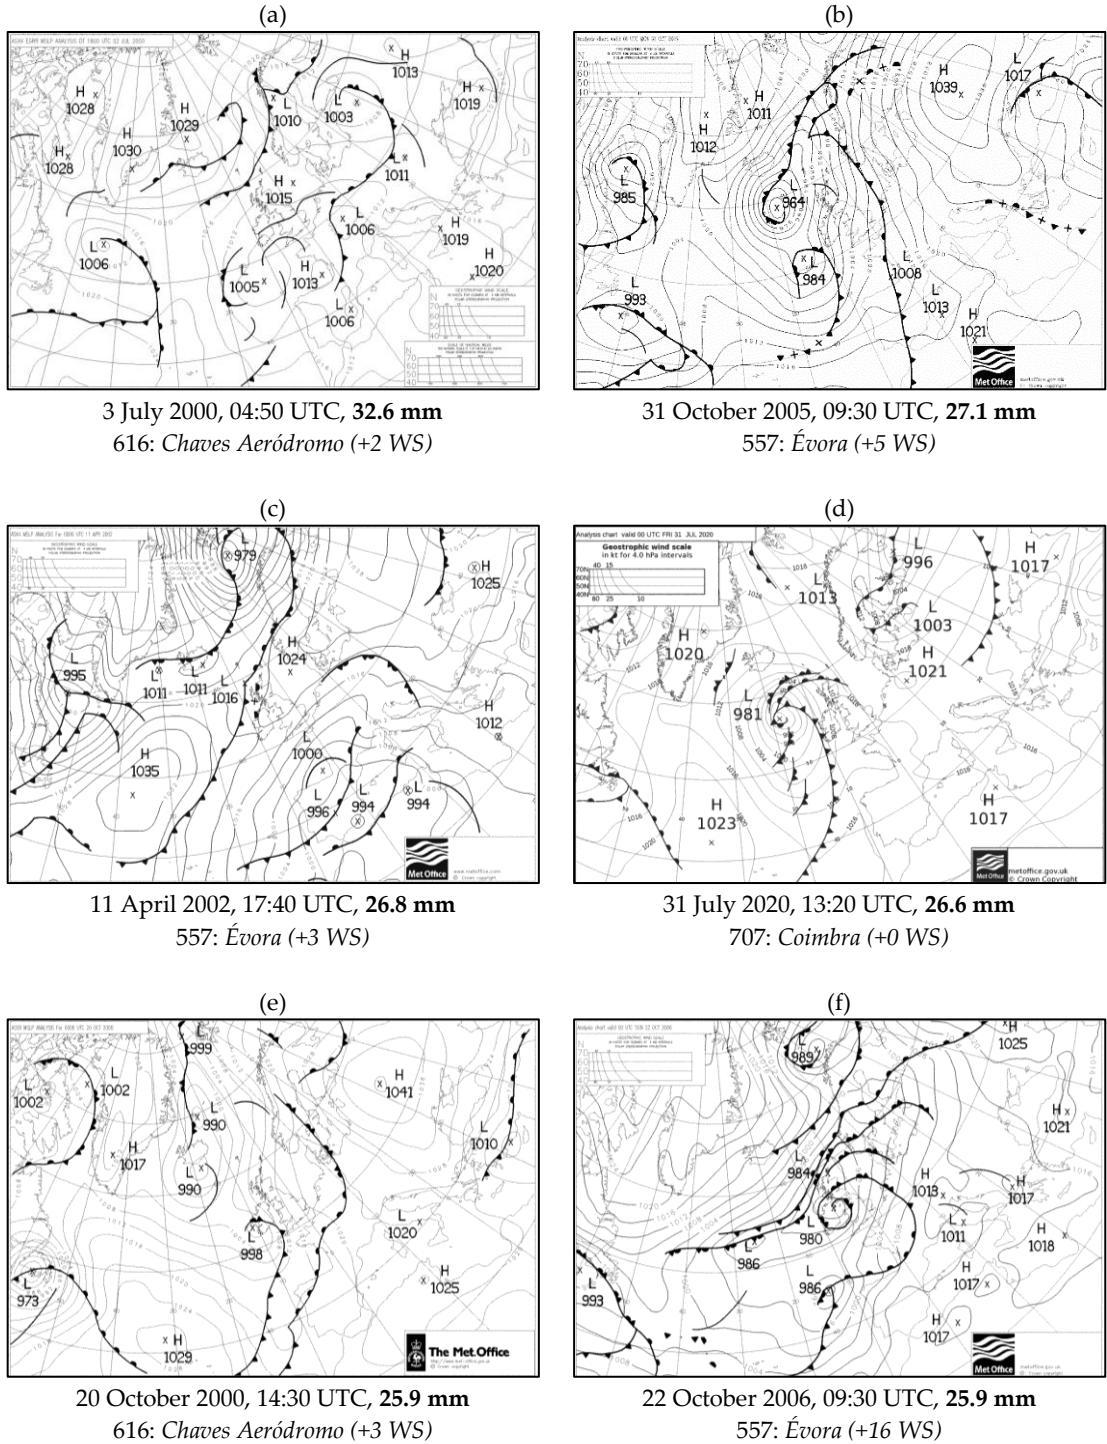

Figure S1. Synoptic analysis charts for the third-to-tenth severest SHHP events (10-minute precipitation $\geq 25 \text{ mm}$). The first two severest are shown in Figure 4. Source: Met Office (metoffice.gov.uk, accessed on 3 February 2022).

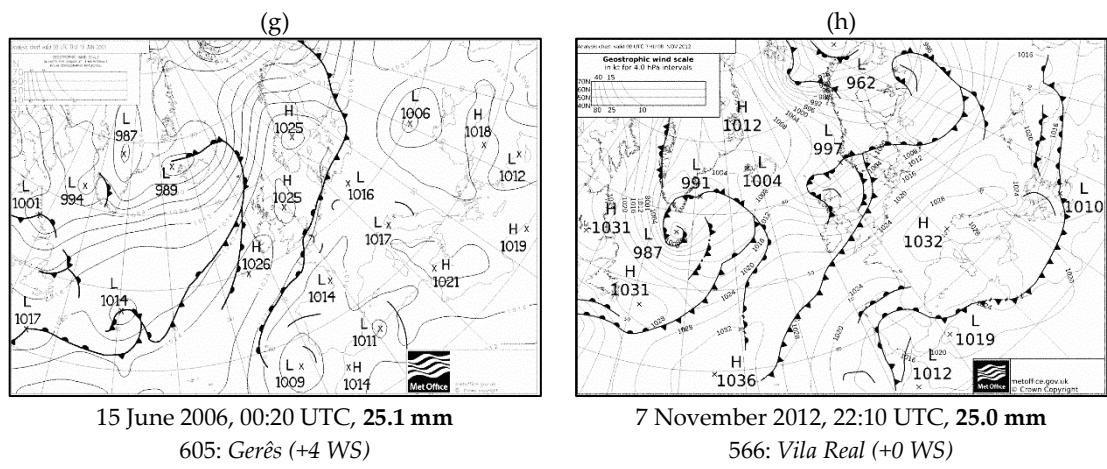

Figure S1. (Continuation).

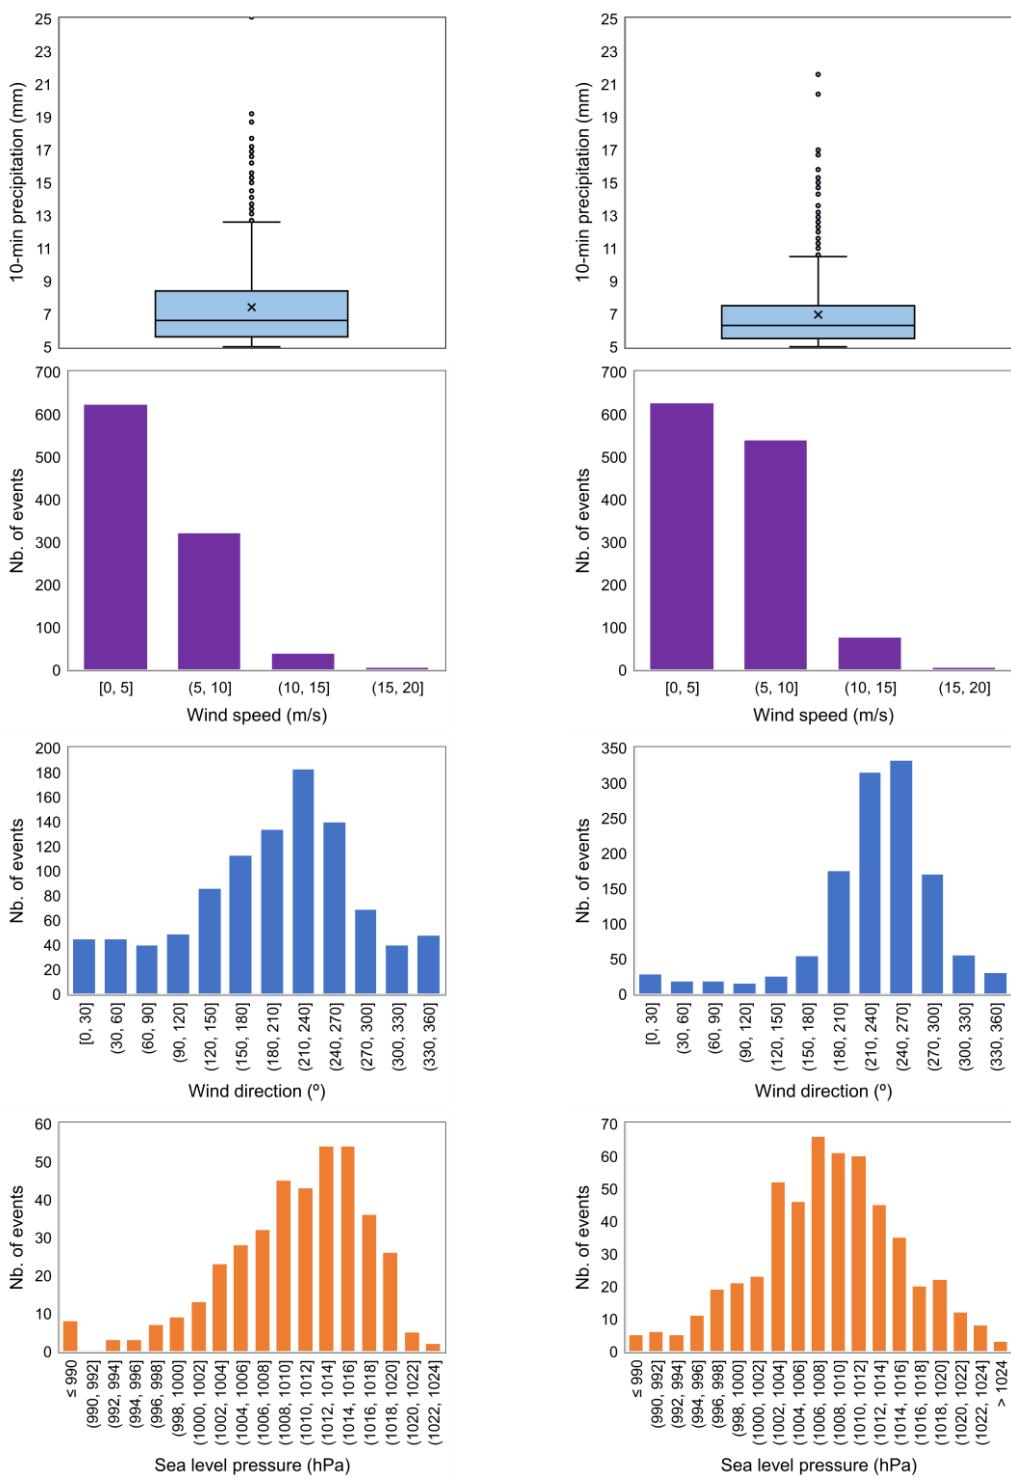

Figure S2. Distribution of the outlined atmospheric variables recorded at the weather stations at the occurrence of the sub-hourly extreme precipitation events and by class separately (*left panels*: RegL, *right panels*: RemL).

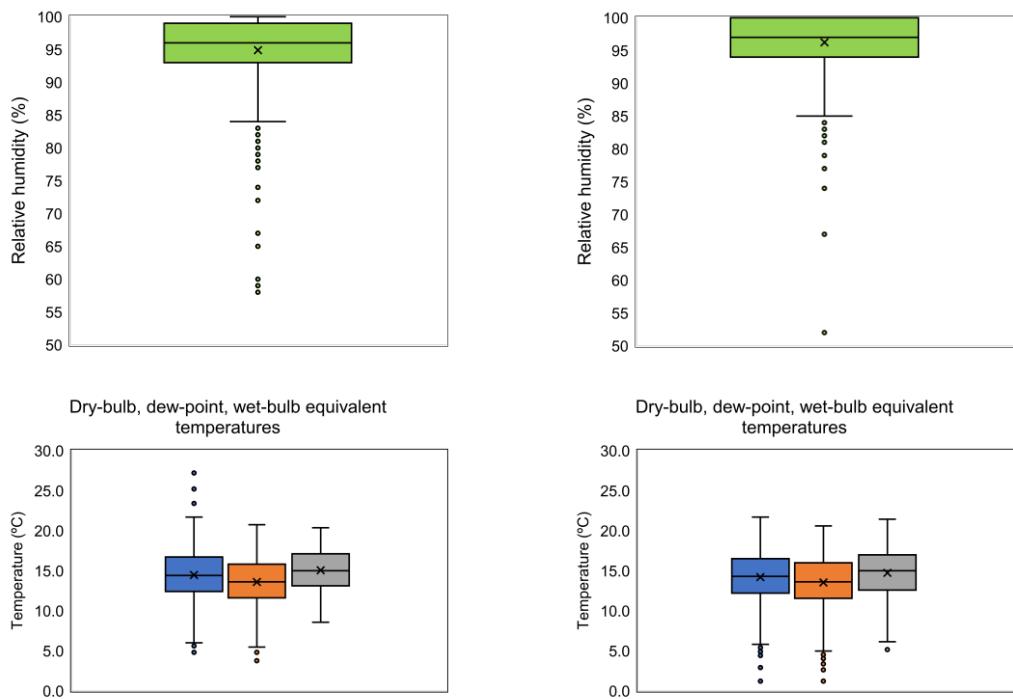

Figure S2. (Continuation).

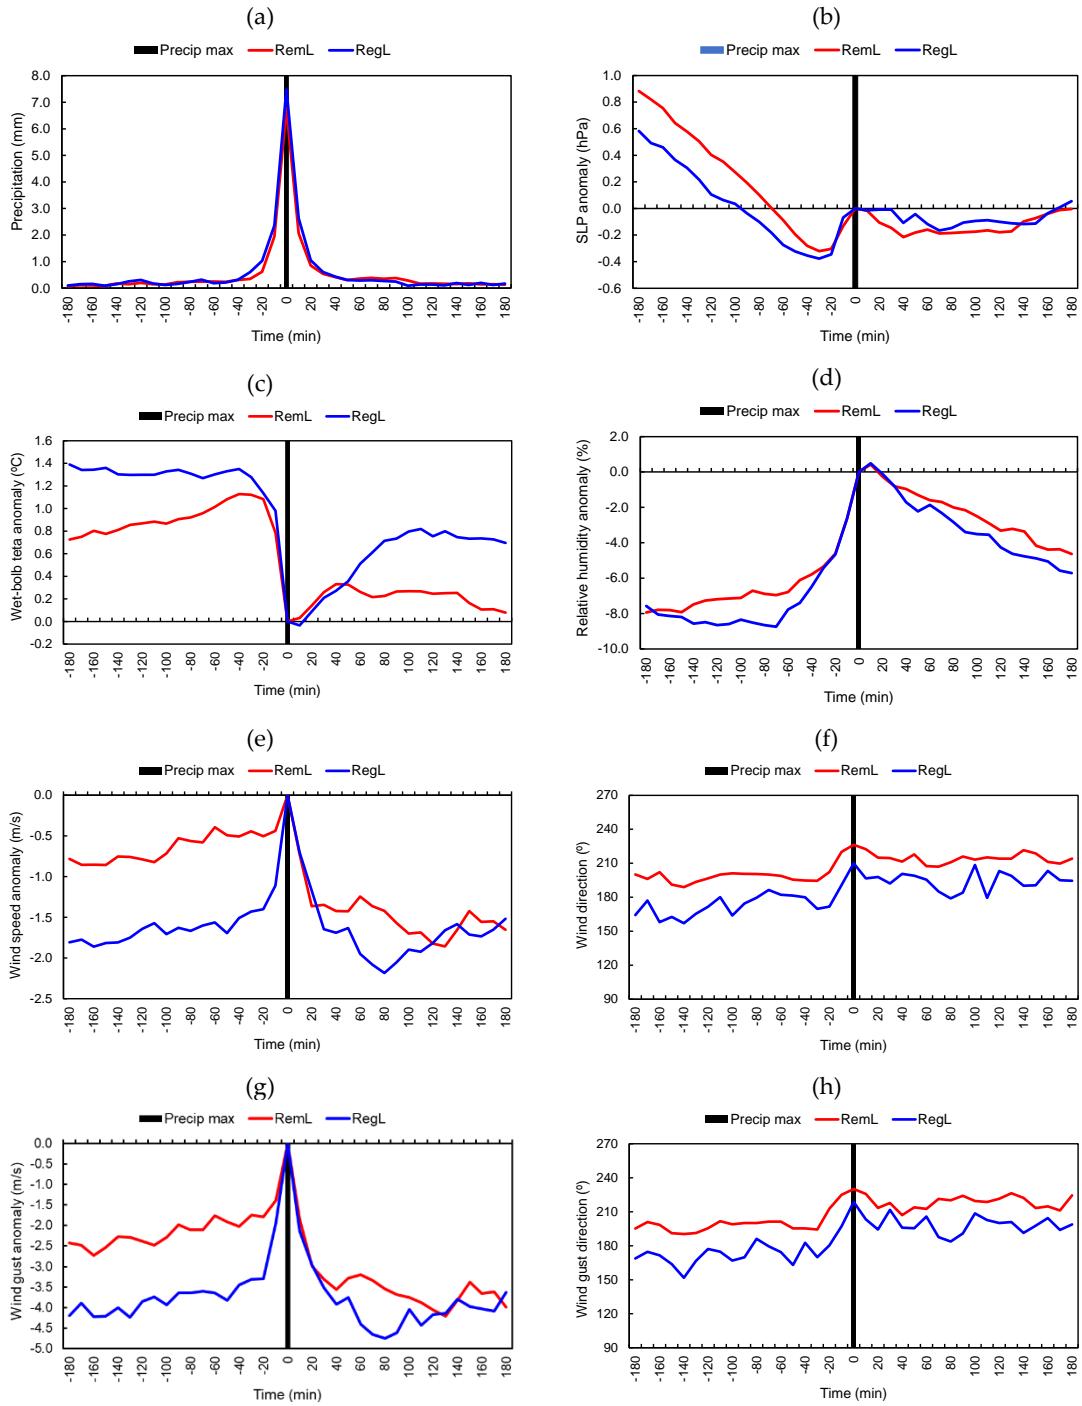

Figure S3. Mean chronological series over a 6-hour window centered at the instant of the event occurrences (87 events with 10-minute precipitation ≥ 5.0 mm, 35 RegL and 52 RemL), for the Lisbon weather station (579: *Lisboa Gago Coutinho*) and for: (a) precipitation, (b) sea level pressure anomaly (w. r. t. the event instant), (c) wet-bulb potential temperature anomaly, (d) relative humidity anomaly, (e) wind speed anomaly, (f) wind direction, (g) wind gust, (h) wind gust direction. The event occurrence is tracked with a vertical black line.

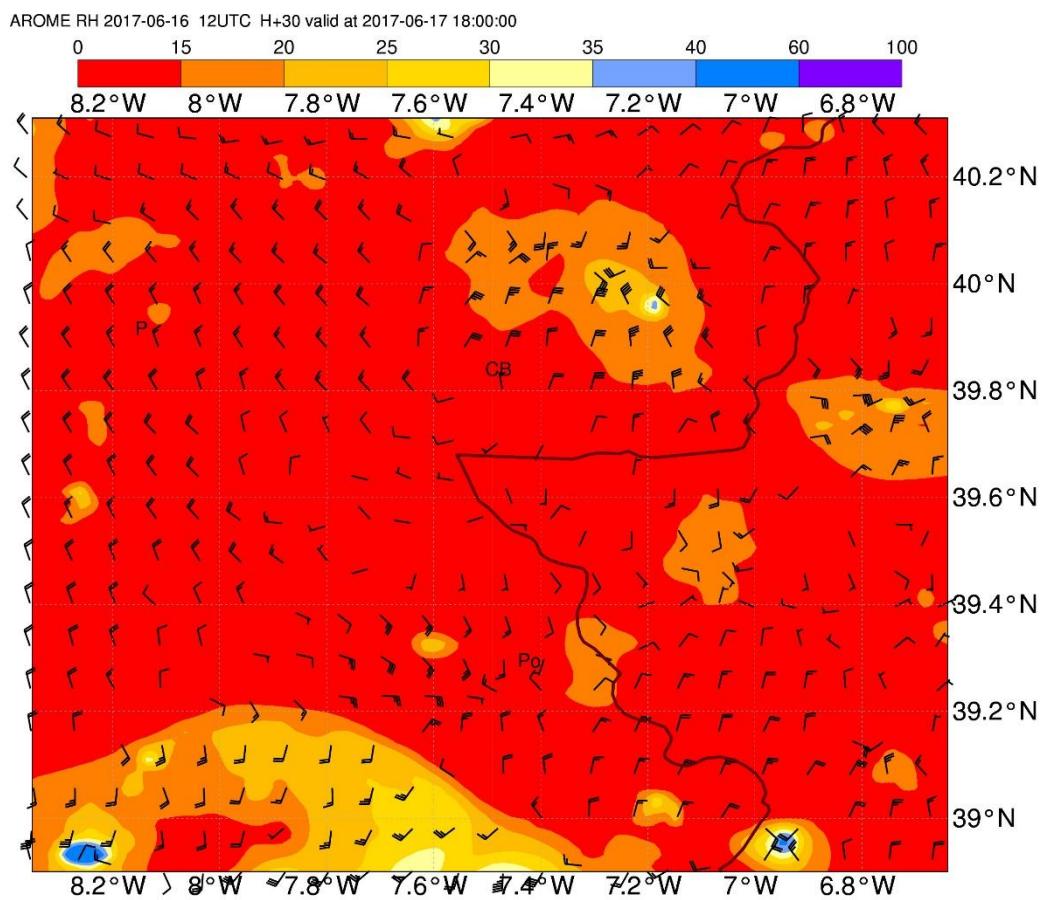

Figure S4. AROME forecast (H+30) of 2-m relative humidity (in %) on 17 June 2017, valid at 18:00 UTC.

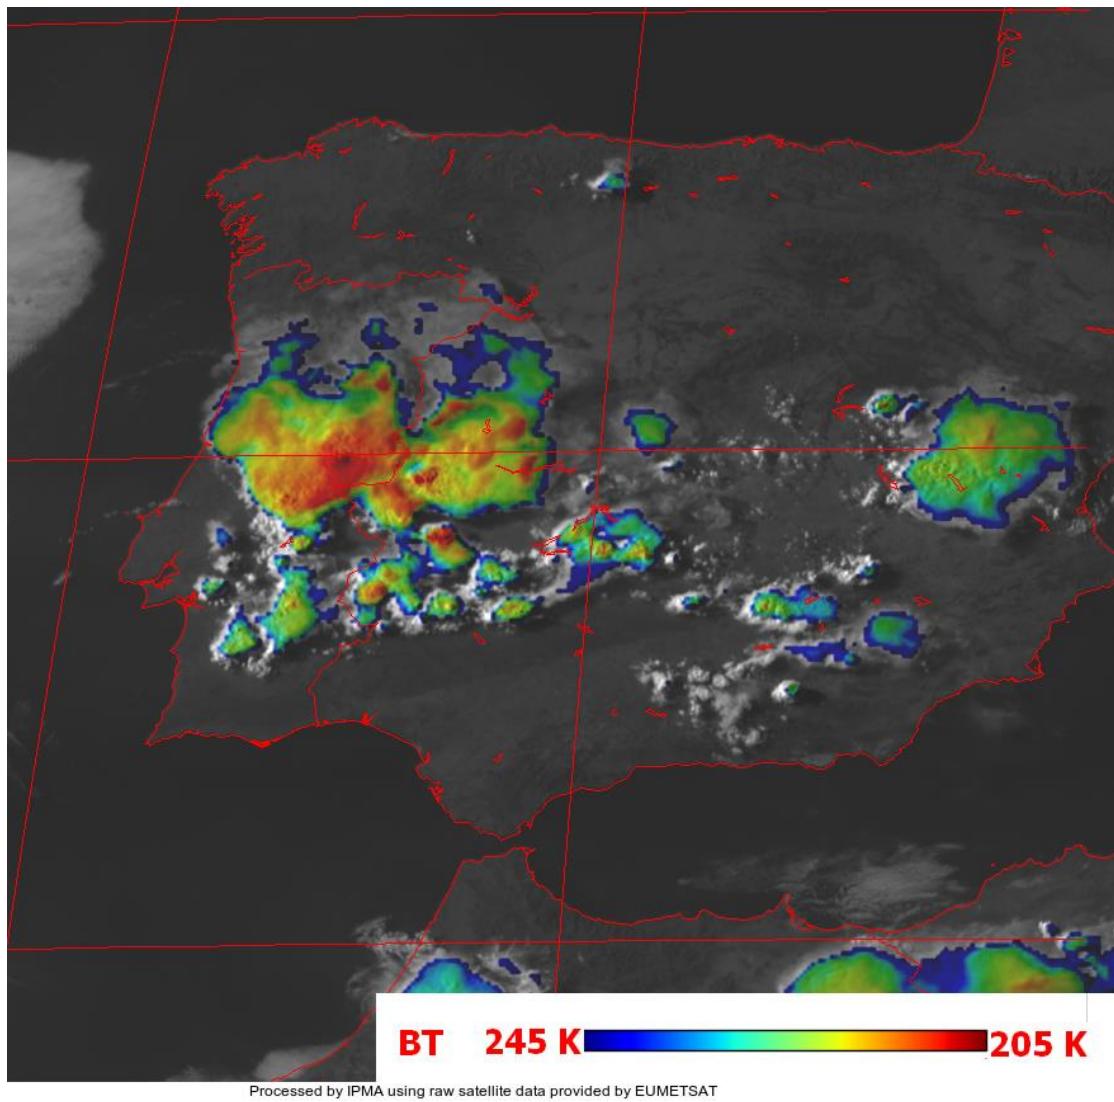

Figure S5. Satellite sandwich product on 17 June 2017, at 17:00 UTC. This product blends the High Resolution Visible (HRV) image (background) with color-enhanced IR10.8 image, showing the details of the cloud top temperature (in K).

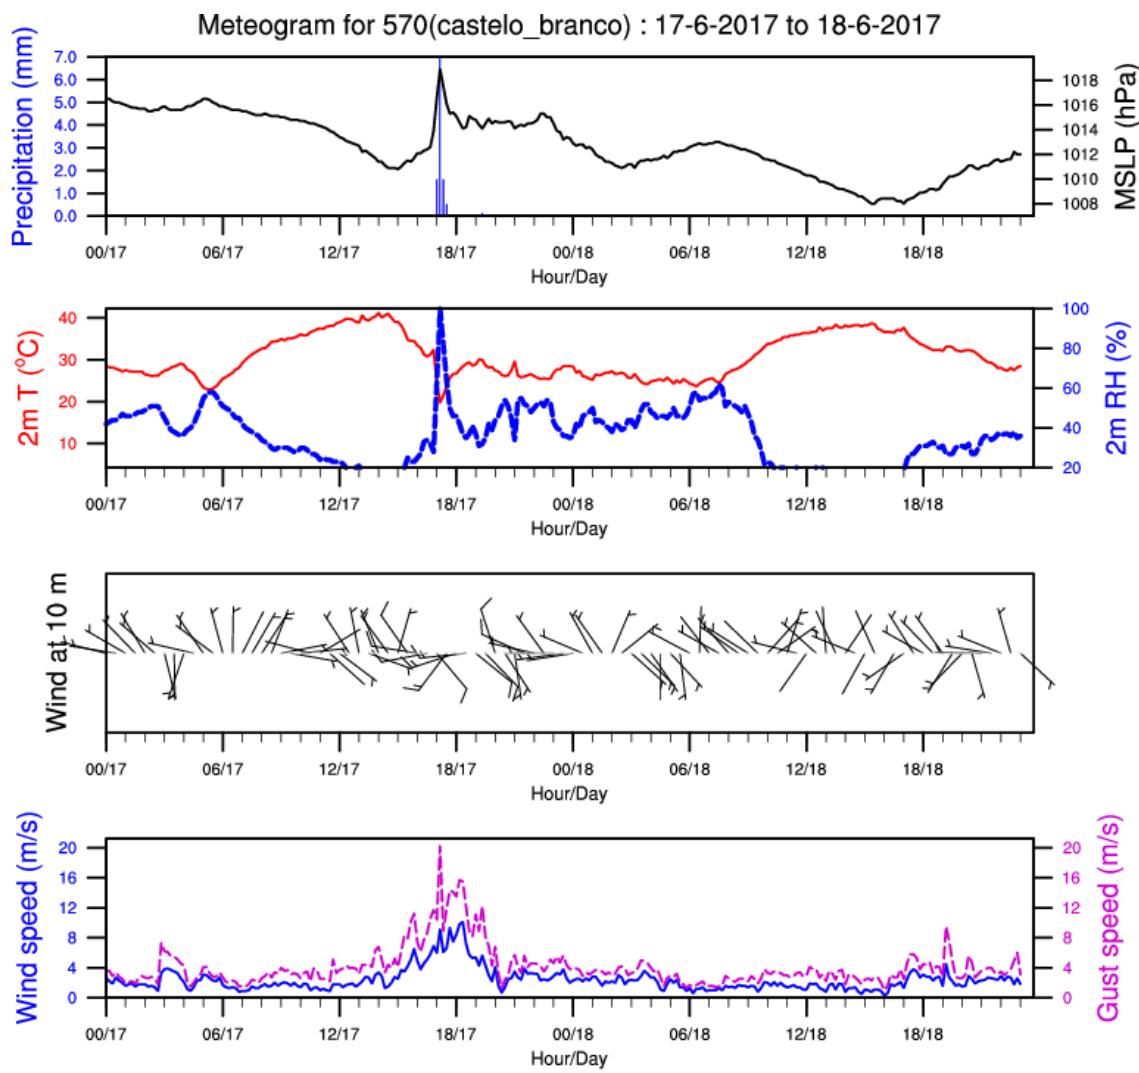

Figure S6. Meteogram based on the 10-minutes observations at the weather station 570 (*Castelo Branco*), on 17 and 18 June 2017.
