Tables S1 to S4 replicate our previously published analysis (Mahapatra, Shreyas, et al. "Longitudinal Epidemiological Study of Autism Subgroups Using Autism Treatment Evaluation Checklist (ATEC) Score." *Journal of autism and developmental disorders* (2018): 1-12) on the new database of MITA participants. Since the previous analysis (performed on the database collected by the Autism Research Institute) was conducted over the two-year-period, Tables S1 to S4 only report LS Mean differences at the baseline and at the end of the two-year period (Month 24). The rest of the tables report the analysis of the three-year period from baseline to Month 36.

Table S1. MITA participants database, age groups: LS Mean differences between Month 24 and Baseline. Data are presented as LS Mean (SE; P-value). The grouping of age bands matches our previous work and is associated with uneven participants distribution over age with younger participant significantly exceeding older participants.

Table S6. LS Means (SE; 95% CI) for Receptive Language MSEC subscale score. The differences between test and control and between Month 36 and Baseline are presented as LS Mean (SE; P-value). A lower score indicates lower severity of ASD symptoms. The negative Test-Control indicates that the Test group had lower score and therefore milder symptoms.
