

Figure S1. Flow chart showing the number of animals initially allocated to the study, randomly assigned to each experimental group, used in each experimental procedure and included in the analyses, with explanation for exclusion of animals/data points or other missing data. IF, immunofluorescence; LDB, light/dark box; NOX2i, NOX2-selective inhibitor, GSK2795039; SNI, animals submitted to the spared nerve injury surgical procedure. Animals from the “short protocol” were euthanized 2 days after SNI/sham surgery, whereas animals from the “long protocol” were euthanized 11 days after SNI surgery. Only animals from the “long protocol” were subjected to behavioral assessment.
