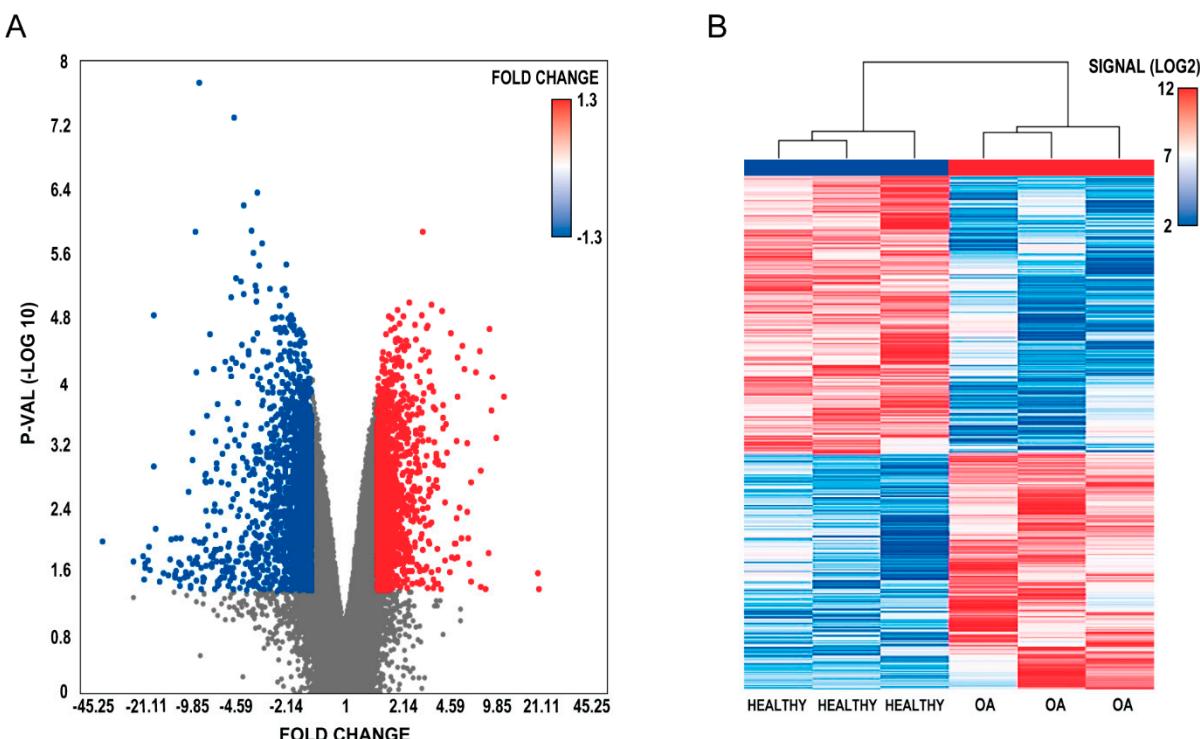

Figure S1. Differential gene expression in MSC from patients with Osteoarthritis (OA) and MSC from healthy donors. (A) Volcano plot for MSC isolated from patients with OA, showing the distribution of significance for all genes. Blue and red dots represent genes with significantly different relative expression (p -value < 0.05 and $|Fold Change| > 1.3$) compared with healthy

donors. (B) Heatmap showing that MSC isolated from patients with OA and from healthy donors can be differentiated based on the gene expression profile. Heatmap constructed using only significantly differentially genes ($p\text{-value} < 0.05$ and $| \text{Fold Change} | > 1.3$). Blue and red dots represent genes with significant relative expression changes ($p\text{-value} < 0.05$ and $| \text{Fold Change} | > 1.3$) in OA MSC compared with healthy MSC.

Supplementary Table S1. List of common differentially expressed genes between both IFN- γ and TGF β 1 MSC senescent models. (Probes bound to uncharacterized encoding genes were excluded).
