Targeting of the Essential *acpP*, *ftsZ*, and *rne* Genes in Carbapenem-Resistant *Acinetobacter baumannii* by Antisense PNA Precision Antibacterials

Alireza Japoni Nejad ^{1,2}, Nader Shahrokhi ² and Peter E. Nielsen ^{1,*}

Supplementary

Supplementary Tables and Figures:

Table S1. (A) Clinical and phenotypic characteristics of the CRAB in this study (MIC µg/mL). (B) Genotypic characteristics of the CRAB strains in this study. The production of carbapenemases is an important mechanism responsible for the carbapenem resistance in *A. baumannii*. The genes encoding carbapenem-hydrolyzing class D β-lactamases (CHDLs), class B metallo-β-lactamases (MBLs) are shown here.

Figure S1. (A) Multiple sequence alignment of *ftsZ* gene, region -20 to +20, using Basic Local Alignment Search Tool (BLAST) on the NCBI website. The BLAST results confirmed the 5' terminal region of the *ftsZ* gene including the ribosomal binding site and the start ATG codon is conserved among *A.baumannii* species. (B) Multiple sequence alignment of the *rne* gene, region -20 to +20, using BLAST on the NCBI website. The BLAST results confirmed the 5' terminal region of the *rne* gene including the ribosomal binding site and the start ATG codon is conserved among *A.baumannii* species.

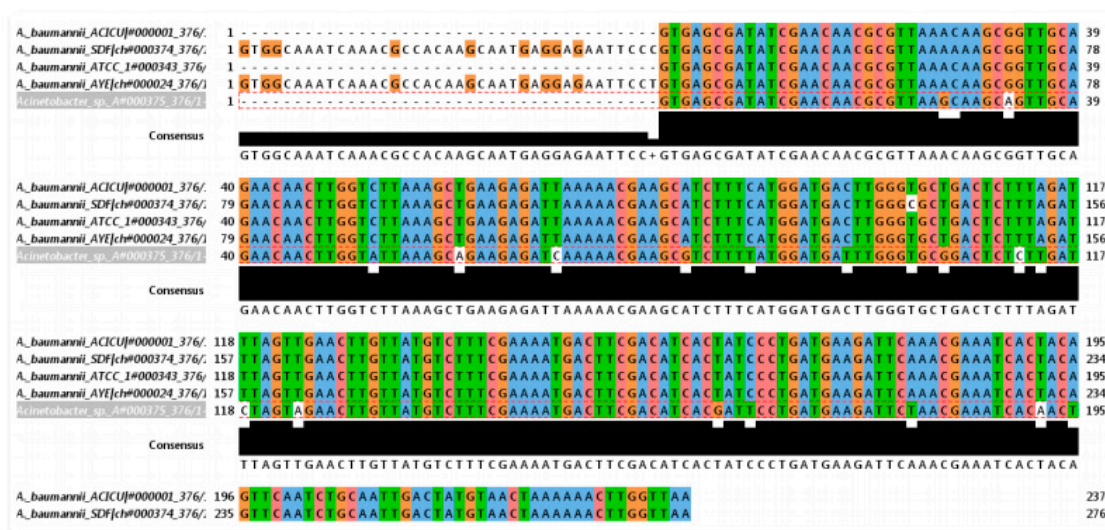

Figure S2. A multiple sequence alignment of *acpP* gene (GenBank database updated January 2019) using the Basic Local Alignment Search Tool (BLAST) on the NCBI website in *A. baumannii* AYE, *A. baumannii* SDF, *A. baumannii* ACICU, *A. baumannii* ATCC 17978 and *Acinetobacter* sp ADP1 (Sequence ID was represented in Table S2)[32]. The *acpP* gene has two lengths in different strains of *A. baumannii*. The *acpP* gene in *A. baumannii* ATCC19606, AYE and SDF strains was 276 bp in length while that was 237 bp in length on both ACICU and ATCC17978 strains.

Figure S3. A multiple sequence alignment of AcpP proteins (UniProt updated 2019/01) using UniProt website (*A. baumannii* AYE UniProt ID: B0V8E8, *A. baumannii* SDF UniProt ID: B0VTY2 and *A. baumannii* ATCC 19606 UniProt ID: D0C9K8).

A

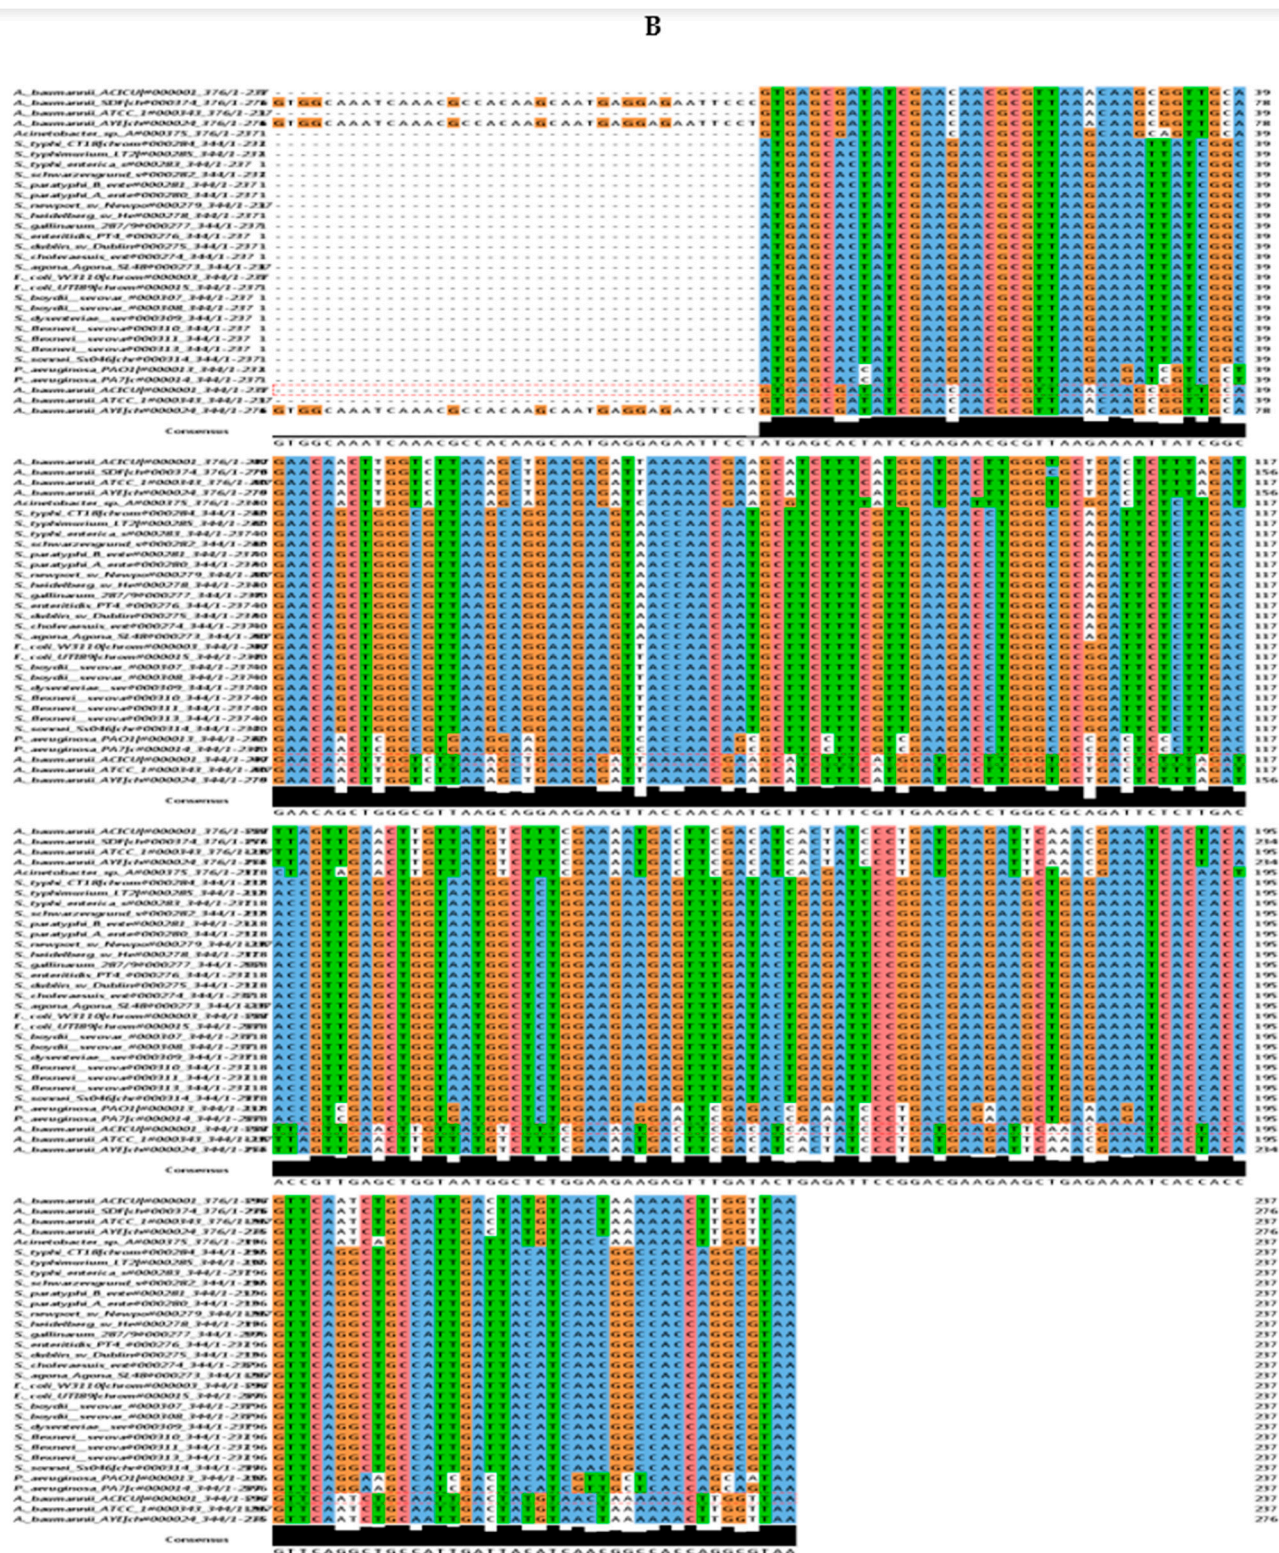

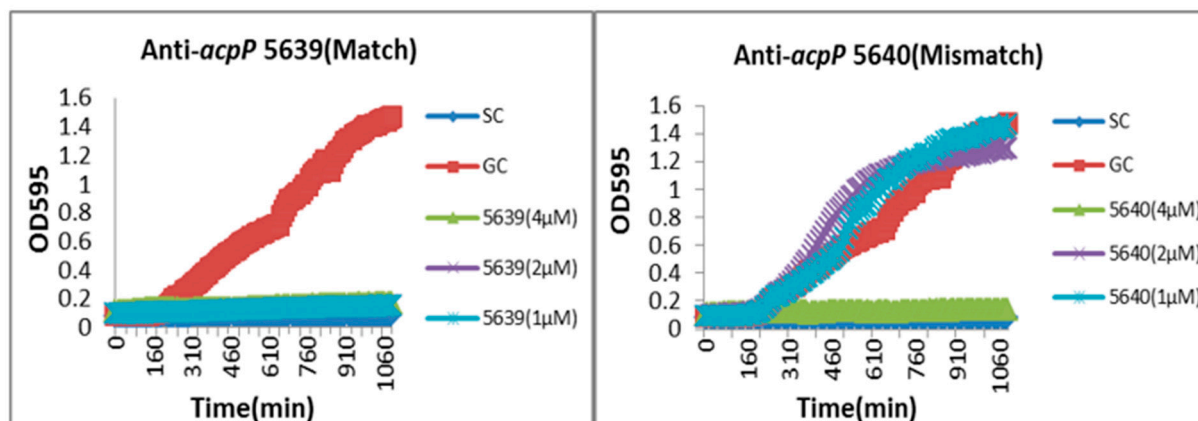

Figure S4. (A) The sequence of the *acpP* gene in *A.baumannii* and the other gram negative bacteria was obtained from genolist database[32]. (B) Multiple sequence alignment of *acpP* gene was done for determination of conserved regions.

(A)

(B)

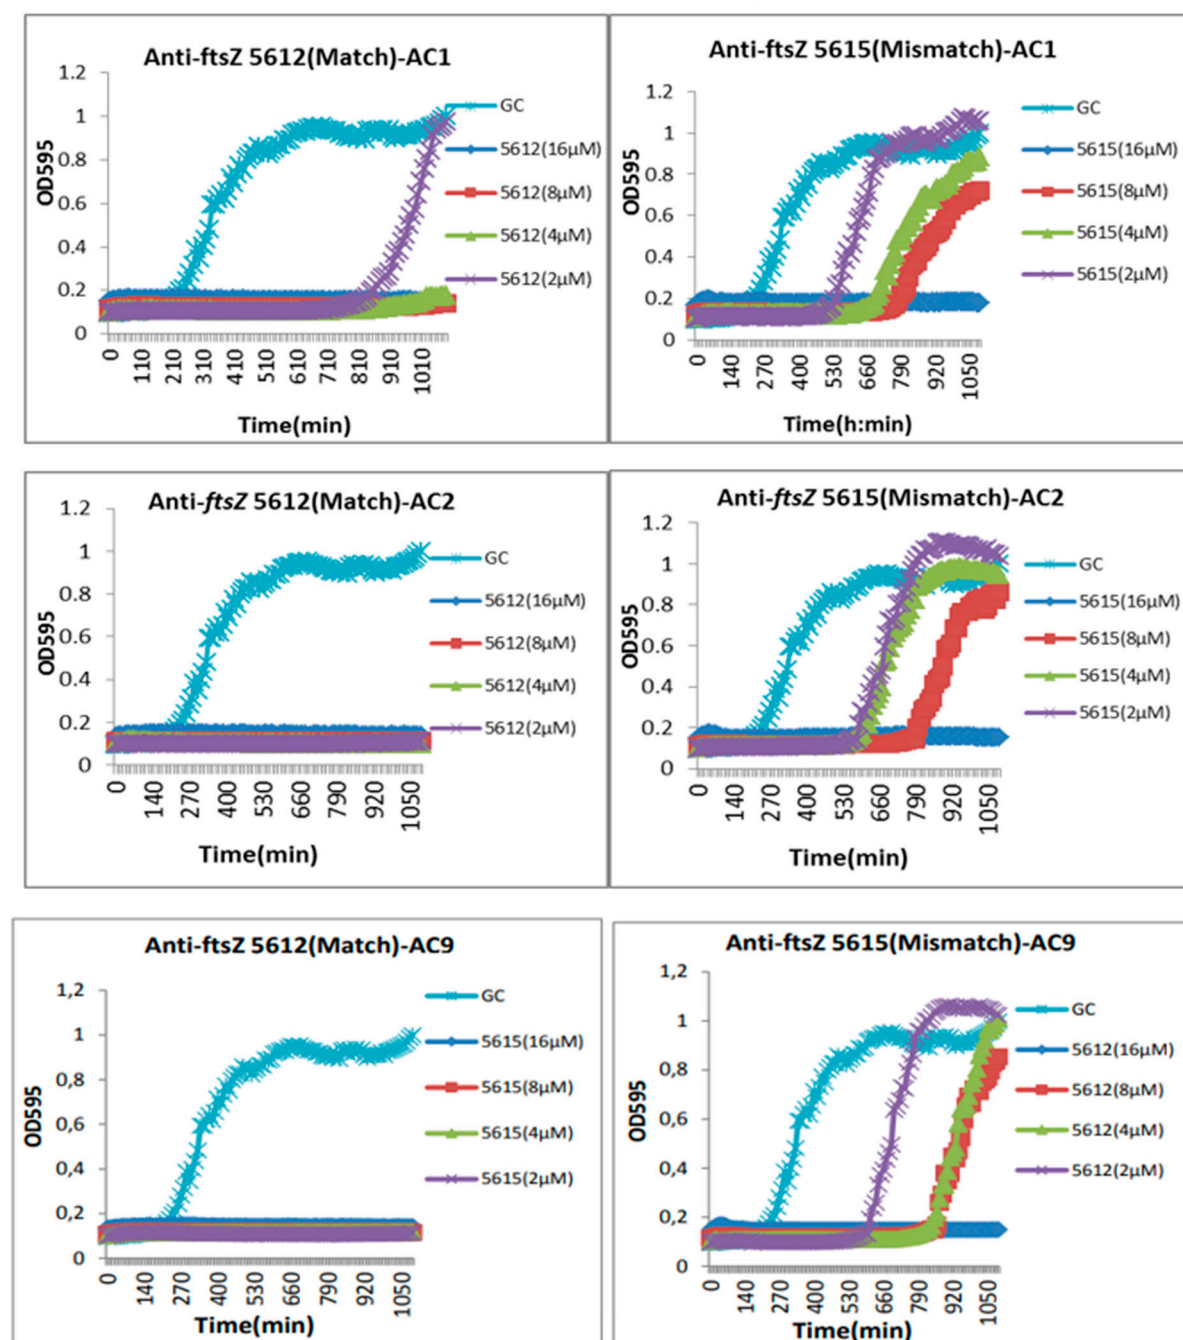

Figure S5. (A) Growth inhibition activity curve of the most active anti-*acpP* (KFF)₃K-PNA(5639) and a corresponding mismatch control (5640) against CRAB strain (AC44). (B) Growth inhibition activity of the most active anti-*ftsZ* (KFF)₃K-PNA(5612) and a corresponding mismatch control (5615) against three CRAB strains (AC1, AC2 and AC9). Concentration-dependent growth inhibition of anti-*ftsZ* (KFF)₃K-PNA(5612) and a corresponding mismatch controls on the growth of three CRAB strains (AC1, AC2 and AC9). Bacteria were grown in the absence of PNA (GC) and different doses of peptide-PNA conjugates (2 μM to 16 μM).

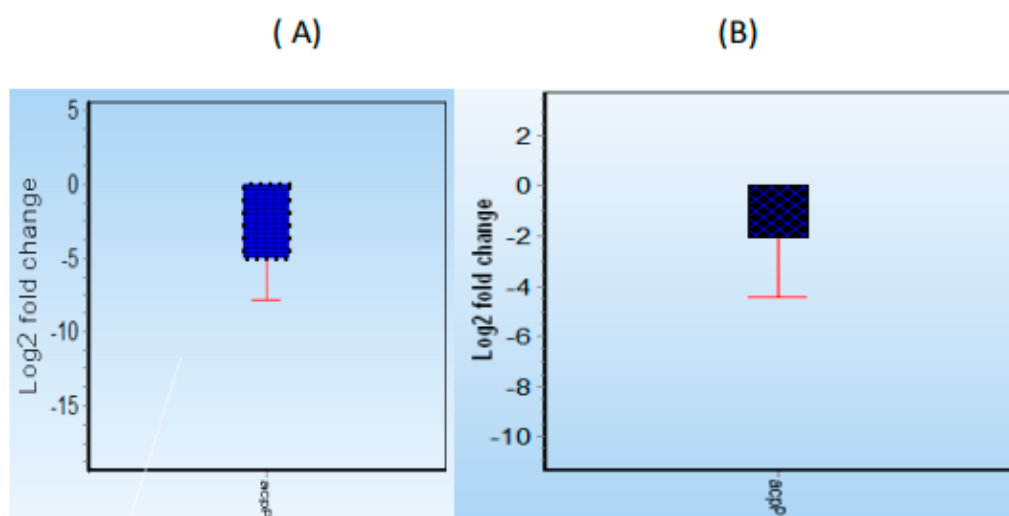

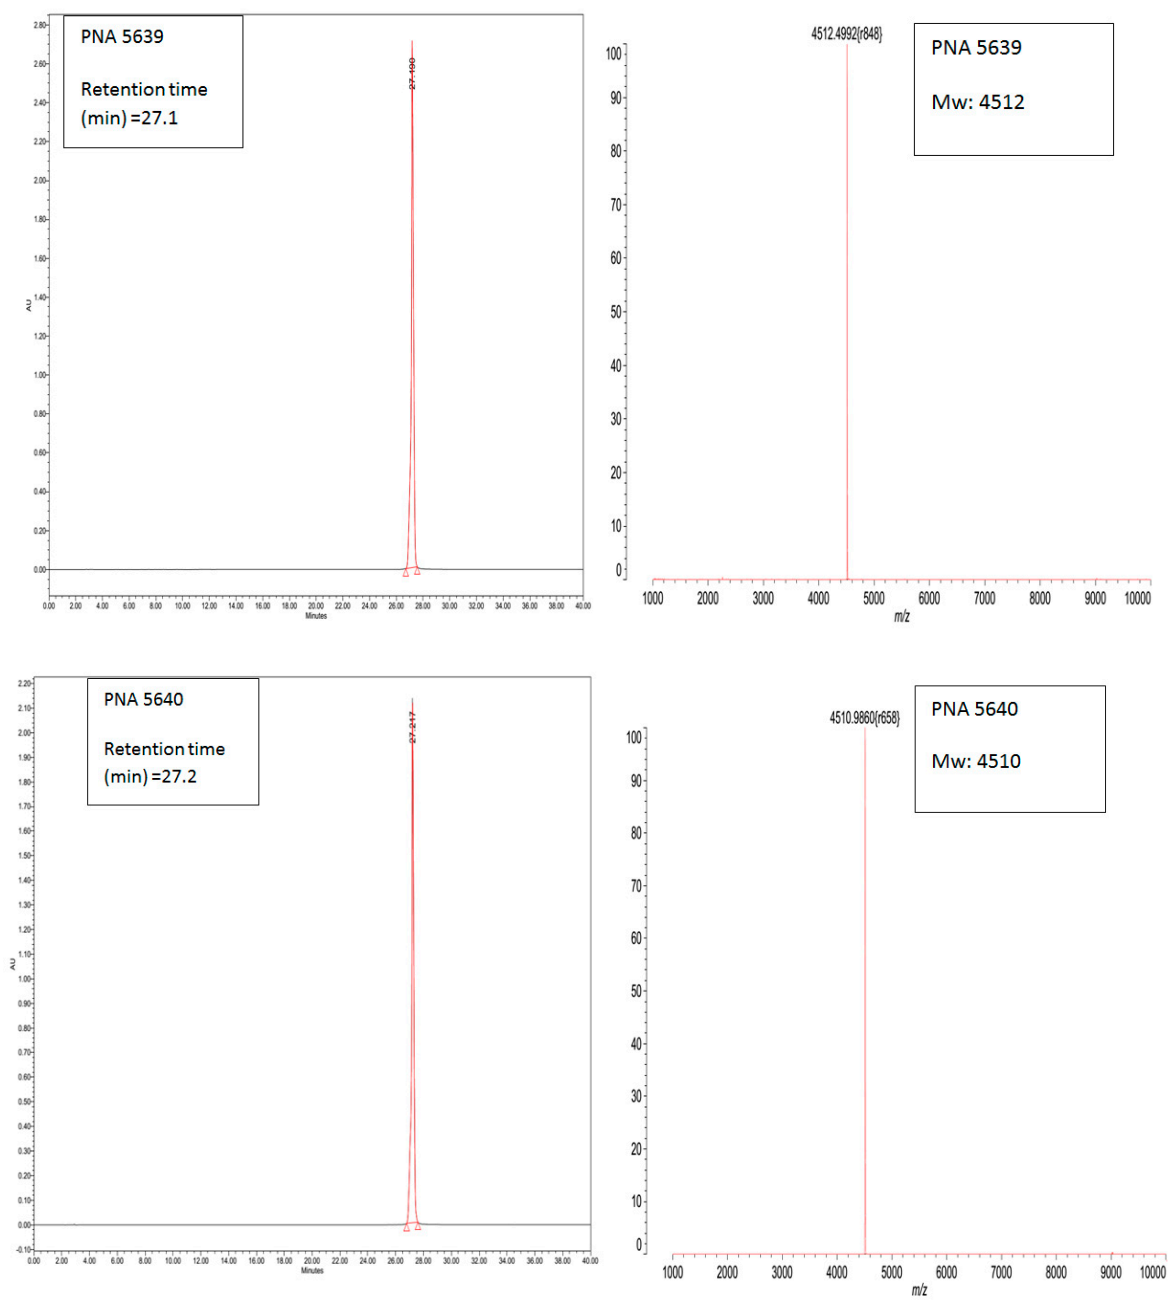

Figure S6. (A) Log2-fold change values determined by qPCR for *acpP* mRNA in CRAB AC44 strain, 1 hour treated with different concentration of anti-*acpP* (KFF)₃K-PNA 5639 (match) compared to the untreated sample. (B) Log2-fold change values determined by qPCR for *acpP* mRNA in CRAB AC44 strain, 1 hour treated with different concentration of anti-*acpP* (KFF)₃K-PNA 5640 (Mismatch) compared with the untreated sample. P values were calculated between (A) match and untreated sample (P-Value = 0.01) and (B) Mismatch and untreated sample (P-Value = 0.059) using twotailed Student's t-test (P<0.05 was considered as significant). Values shown in the graphs are the mean of three replicates. Error bars depict standard error of the mean.

Figure S7. Analytical HPLC and MALDI-TOF mass spectrometry results of the most active BPP-PNAs.
