

Supplementary Table S1. Number of mice used for each Experiment. A total number of 31 control and 25 mutant mice were included in the study. ECGs for all these animals are shown in Table 1. 22 mice (12 controls, 10 mutants) were treated with doxorubicin, either chronically or acutely. Seven mice died after the tamoxifen treatment and before the experiments, without significant differences between control and mutants. Some untreated mice were unsuccessfully employed for cardiomyocyte isolation through FACS (not included in the results). Some samples from the same mice were used for two different techniques.
