Table S1. Distribution and proportion of missing variables.

Table S2. Data before and after Box-Cox transformation and standardization.

Table S3. Model performance in the training test.

Table S4. Univariable and multivariable Cox regression of all-cause death and first appropriate shock.

Table S5. Parameter search space for each model in sensitivity analysis.

Figure S1. Continuous variables' contribution to the outcome in the XGBoost model predicting all-cause death.

Figure S2. Continuous variables' contribution to the outcome in the SSVM model predicting the first appropriate shock.

Figure S3. Model interpretability using SHAP values.

Figure S4. Comparison of C-index between CPH and ML algorithms in sensitivity analysis.

Figure S5. Model interpretability using SHAP values in sensitivity analysis.

Table S1. Distribution and proportion of missing variables.

| Variables | Number of missing values | Percentage (%) |
|-----------------|--------------------------|----------------|
| RVD | 34 | 3.8 |
| hs-CRP | 33 | 3.7 |
| NT-proBNP | 21 | 2.4 |
| IVS | 14 | 1.6 |
| Body mass index | 13 | 1.5 |
| Age | 5 | 0.6 |
| LAD | 4 | 0.5 |
| Hemoglobin | 3 | 0.3 |
| Systolic BP | 1 | 0.1 |
| Diastolic BP | 1 | 0.1 |
| Creatinine | 1 | 0.1 |
| BUN | 1 | 0.1 |
| Heart rate | 1 | 0.1 |
| LVEDD | 1 | 0.1 |

BP, blood pressure; BUN, blood urea nitrogen; hs-CRP, high-sensitivity C-reactive protein; IVS, interventricular septum thickness; LAD, left atrial diameter; LVEDD, left ventricular end-diastolic diameter; NT-proBNP, N-terminal pro-brain natriuretic peptide; RVD, right ventricular diameter.

Table S2. Data before and after Box-Cox transformation and standardization.

| Transformed value | -2 | -1 | 0 | 1 | 2 | |
|--|-------|-------|-------|--------|--------|--|
| Original value | | | | | | |
| Dataset for all-cause death | | | | | | |
| Age (years) | 30.1 | 47.3 | 60.4 | 71.5 | 81.4 | |
| Body mass index (kg/m ²) | 18.3 | 21.3 | 24.7 | 28.3 | 32.2 | |
| Systolic BP (mmHg) | 91.3 | 104.6 | 119.8 | 137.1 | 156.8 | |
| Diastolic BP (mmHg) | 53.5 | 63.7 | 73.8 | 83.9 | 93.9 | |
| NT-proBNP (pg/mL) | 30.2 | 175.5 | 751.5 | 2597.0 | 7653.8 | |
| Creatinine (μmol/L) | 54.6 | 67.9 | 87.5 | 118.9 | 175.1 | |
| BUN (mmol/L) | 3.3 | 4.6 | 6.7 | 10.0 | 15.4 | |
| hs-CRP (mg/L) | 0.1 | 0.5 | 2.1 | 6.8 | 17.4 | |
| Hemoglobin (g/L) | 103.5 | 122.3 | 140.4 | 157.9 | 175.0 | |
| Heart rate (beats per minute) | 46.9 | 55.8 | 67.0 | 81.4 | 99.9 | |
| LAD (mm) | 29.0 | 34.8 | 41.8 | 50.2 | 60.3 | |
| IVS (mm) | 6.2 | 7.5 | 9.1 | 11.3 | 14.3 | |
| LVEDD (mm) | 40.5 | 49.6 | 59.8 | 71.2 | 83.7 | |
| LVEF (%) | 18.6 | 28.9 | 41.8 | 57.4 | 75.9 | |
| RVD (mm) | 16.4 | 18.7 | 21.9 | 26.3 | 32.7 | |
| Dataset for first appropriate shock | | | | | | |
| Age (years) | 29.2 | 46.7 | 60.1 | 71.6 | 81.8 | |
| Body mass index (kg/m ²) | 18.2 | 21.2 | 24.5 | 28.4 | 32.7 | |
| Systolic BP (mmHg) | 90.0 | 104.0 | 119.8 | 137.6 | 157.5 | |
| Diastolic BP (mmHg) | 52.5 | 63.0 | 73.5 | 83.9 | 94.4 | |

| | | | | | |
|----------------------------------|-------|-------|-------|--------|--------|
| NT-proBNP (pg/mL) | 30.1 | 171.8 | 740.9 | 2607.8 | 7873.5 |
| Creatinine ($\mu\text{mol/L}$) | 54.2 | 67.7 | 87.6 | 118.5 | 171.3 |
| BUN (mmol/L) | 3.2 | 4.5 | 6.6 | 10.0 | 15.6 |
| hs-CRP (mg/L) | 0.1 | 0.5 | 2.1 | 6.6 | 16.4 |
| Hemoglobin (g/L) | 102.6 | 122.7 | 141.4 | 159.0 | 175.7 |
| Heart rate (beats per minute) | 46.6 | 55.7 | 67.1 | 81.5 | 99.9 |
| LAD (mm) | 28.5 | 34.5 | 41.7 | 50.2 | 60.4 |
| IVS (mm) | 6.2 | 7.4 | 9.1 | 11.4 | 14.7 |
| LVEDD (mm) | 40.1 | 49.0 | 59.3 | 70.9 | 84.1 |
| LVEF (%) | 17.6 | 28.7 | 42.2 | 58.2 | 76.4 |
| RVD (mm) | 16.3 | 18.7 | 21.9 | 26.5 | 33.6 |

Of note, data preprocessing was independent for the modeling process of all-cause death and appropriate shock. Therefore, transformed values were not necessarily the same in these two datasets.

LVEF, left ventricular ejection fraction; other abbreviations as in Supplemental Table S1.

Table S3. Model performance in the training test

| Outcome events | Algorithms | | | | |
|-----------------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| | CPH | EN-Cox | RSF | SSVM | XGBoost |
| Primary analysis | | | | | |
| All-cause death | 0.795 (0.755-0.825) | 0.784 (0.744-0.819) | 0.852 (0.819-0.881) | 0.765 (0.728-0.800) | 0.831 (0.796-0.867) |
| The first appropriate shock | 0.644 (0.607-0.688) | 0.652 (0.615-0.693) | 0.818 (0.788-0.848) | 0.708 (0.673-0.741) | 0.715 (0.681-0.754) |
| Sensitivity analysis | | | | | |
| All-cause death | 0.793 (0.753-0.823) | 0.781 (0.741-0.816) | 0.874 (0.846-0.898) | 0.764 (0.728-0.798) | 0.823 (0.791-0.860) |
| The first appropriate shock | 0.644 (0.607-0.687) | 0.642 (0.606-0.676) | 0.842 (0.818-0.865) | 0.697 (0.663-0.730) | 0.713 (0.678,0.755) |

Values are presented as the mean (95% confidence interval).

CPH, Cox proportional hazards; EN-Cox, elastic net Cox regression; RSF, random survival forests; SSVM, survival support vector machine; XGBoost, extreme gradient boosting.

Table S4. Univariable and multivariable Cox regression of all-cause death and first appropriate shock.

| Characteristic | all-cause death | | | | First appropriate shock | | | |
|--------------------------------|-----------------|---------|---------------|---------|-------------------------|---------|---------------|---------|
| | univariable | | multivariable | | univariable | | multivariable | |
| | Hazard Ratio | p-value | Hazard Ratio | p-value | Hazard Ratio | p-value | Hazard Ratio | p-value |
| Age | 1.36 | <0.001 | 1.24 | 0.021 | 0.86 | 0.033 | 0.87 | 0.069 |
| Male sex | 1.47 | 0.064 | | | 2.19 | <0.001 | 1.68 | 0.011 |
| Body mass index | 0.94 | 0.454 | | | 0.99 | 0.879 | | |

|----------------|------|--------|------|-------|------|-------|

Note: all continuous variables were processed with Box-Cox transformation and standardization; one unit change is illustrated in Supplemental Table S2.

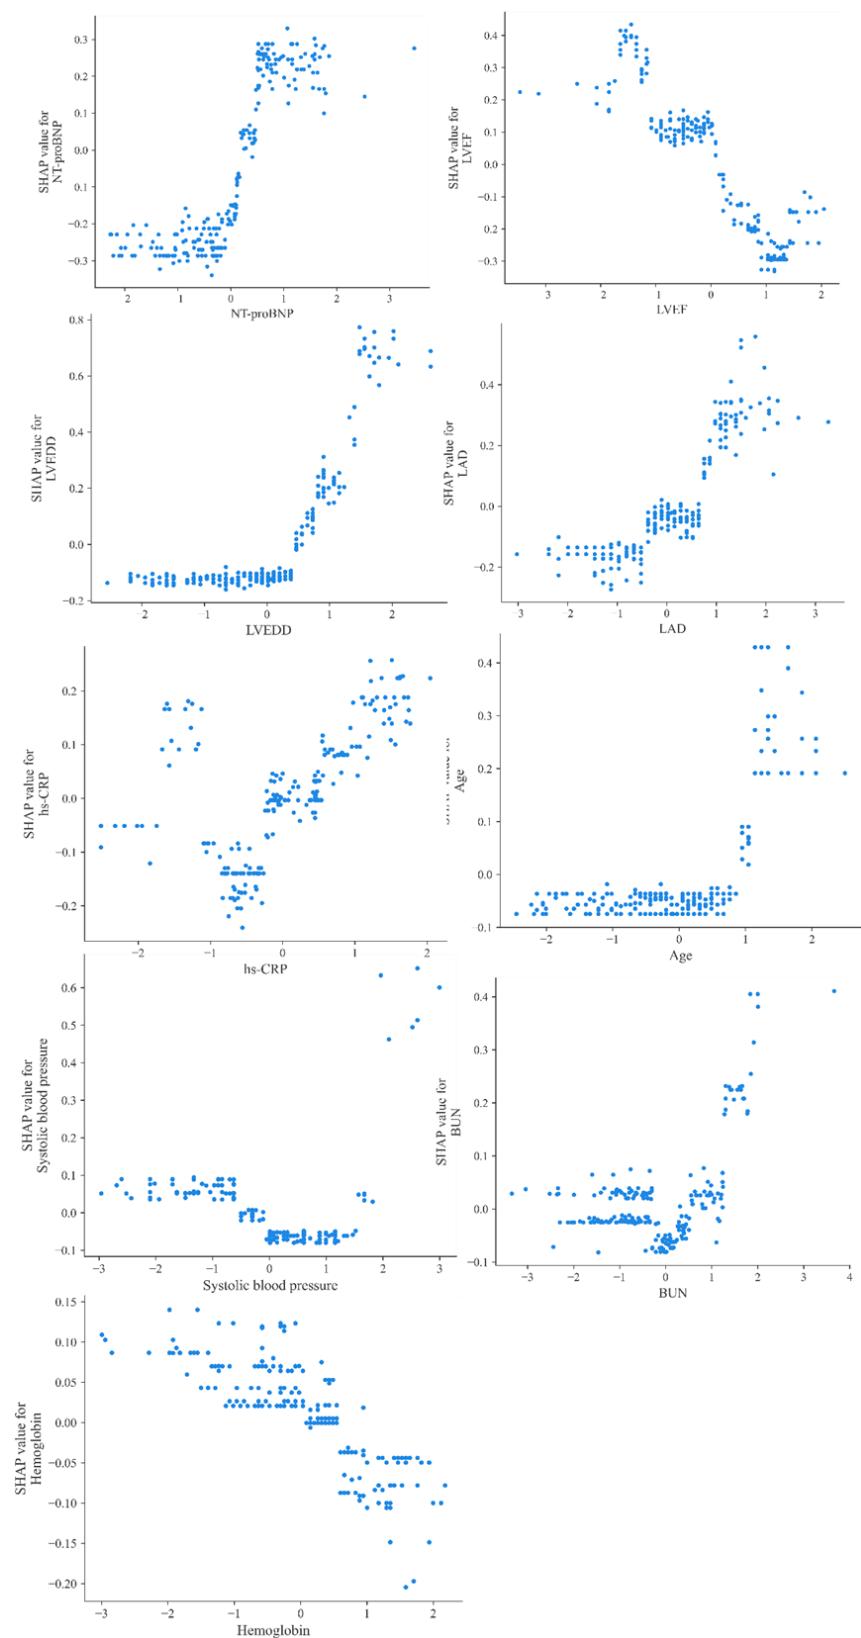

ACEI/ARB/ARNI, angiotensin-converting enzyme inhibitor/angiotensin receptor blocker/angiotensin receptor-neprilysin inhibitor; CLBBB, complete left bundle branch block; CRBBB, complete right bundle branch block; ICD, implantable cardioverter-defibrillator; MRA, mineralocorticoid receptor antagonist; NYHA, New York Heart Association; PVC, premature ventricular contractions; other abbreviations as in Supplemental Tables S1 and 2.

Table S5. Parameter search space for each model in sensitivity analysis.

| Algorithms | Parameter | Search space | Optimal Parameter for death prediction | Optimal Parameter for shock prediction |
|------------|--|--|--|--|
| EN-Cox | l1 ratio | 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0 | 0.8 | 0.1 |
| | alpha | Log distribution from 0.0001 to 1 | 0.0281 | 0.1048 |
| RSF | number of trees | 100, 200, 300, 400, 400 500 | | 500 |
| | maximum depth | 2, 3, 4, 5, 6, 7 | 5 | 6 |
| | minimum samples required to split | 10, 14, 28, 22, 40, 50 | 14 | 22 |
| | minimum samples required at leaf nodes | 5, 7, 9, 11, 20, 25 | 5 | 7 |
| | | | | |
| SSVM | alpha | 0.1, 1, 10, 100 | 0.1 | 0.1 |
| | gamma | 1, 0.1, 0.01, 0.001 | 1 | 0.001 |
| | kernel | rbf, poly, linear, poly sigmoid, cosine | | poly |
| | degree (poly kernels only) | 2, 3, 4, 5 | 4 | 2 |
| XGboost | loss function | CoxPH | - | - |
| | learning rate | 0.01, 0.05, 0.10 | 0.1 | 0.1 |
| | number of trees | 20, 25, 30 | 30 | 30 |
| | maximum depth | 1, 2 | 2 | 2 |
| | fraction of samples | 0.4, 0.5 | 0.4 | 0.4 |
| | fraction of features | 0.4, 0.5 | 0.4 | 0.4 |
| | minimum samples required to split | 1, 2 | 1 | 1 |
| | | | | |

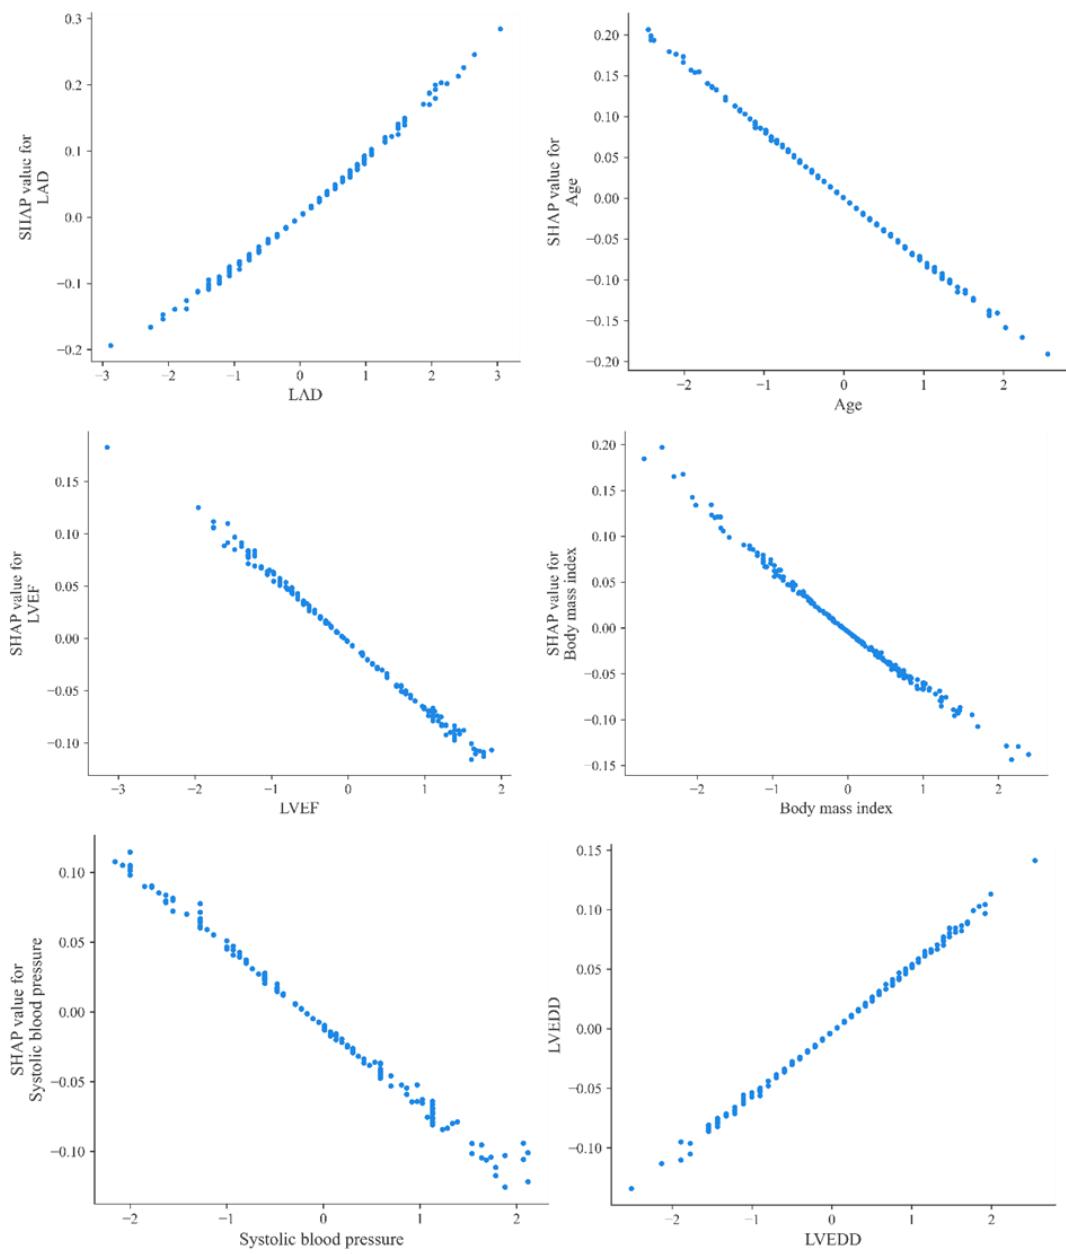

Abbreviations as in Supplemental Tables S4.

Figure S1. Continuous variables' contribution to the outcome in the XGBoost model predicting all-cause death.

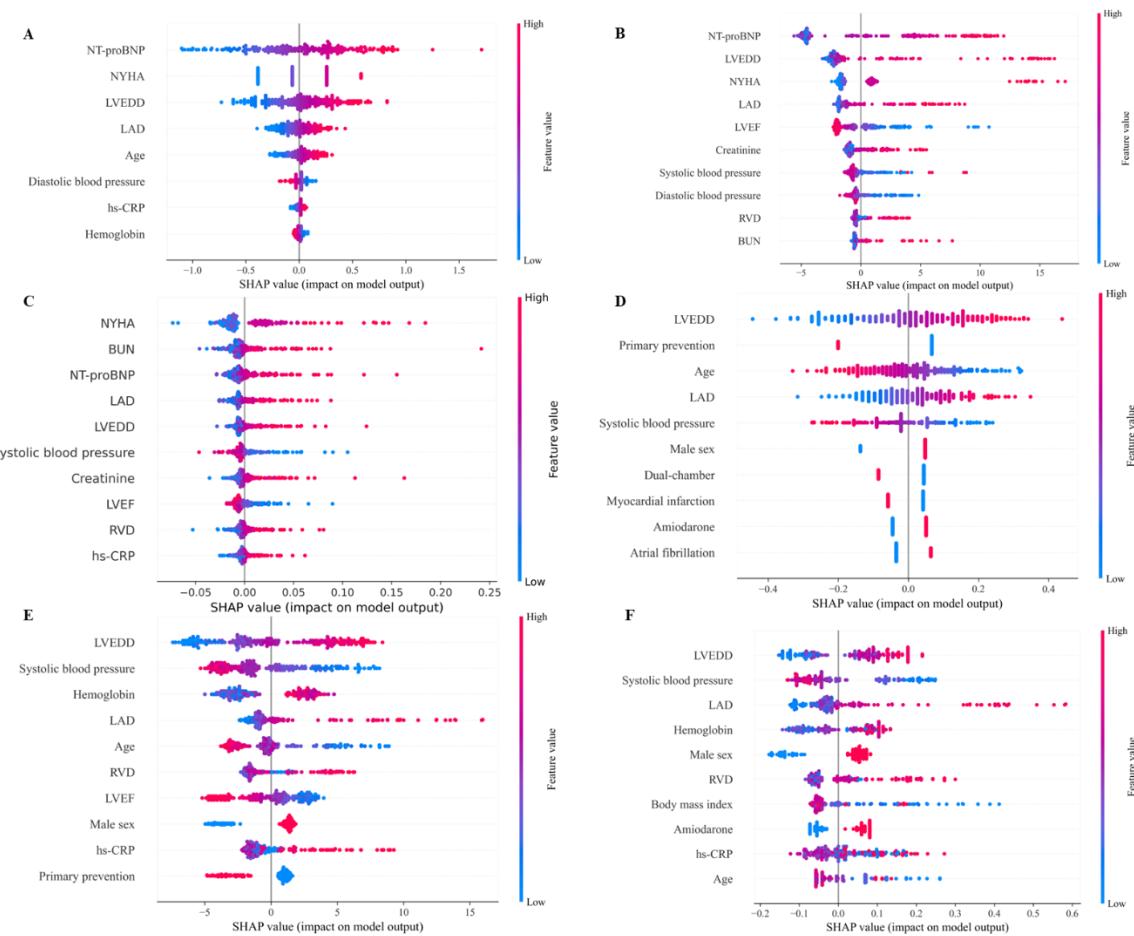

Abbreviations as in Supplemental Tables S1-4.

Figure S2. Continuous variables' contribution to the outcome in the SSVM model predicting the first appropriate shock.

Abbreviations as in Supplemental Tables S1-4.

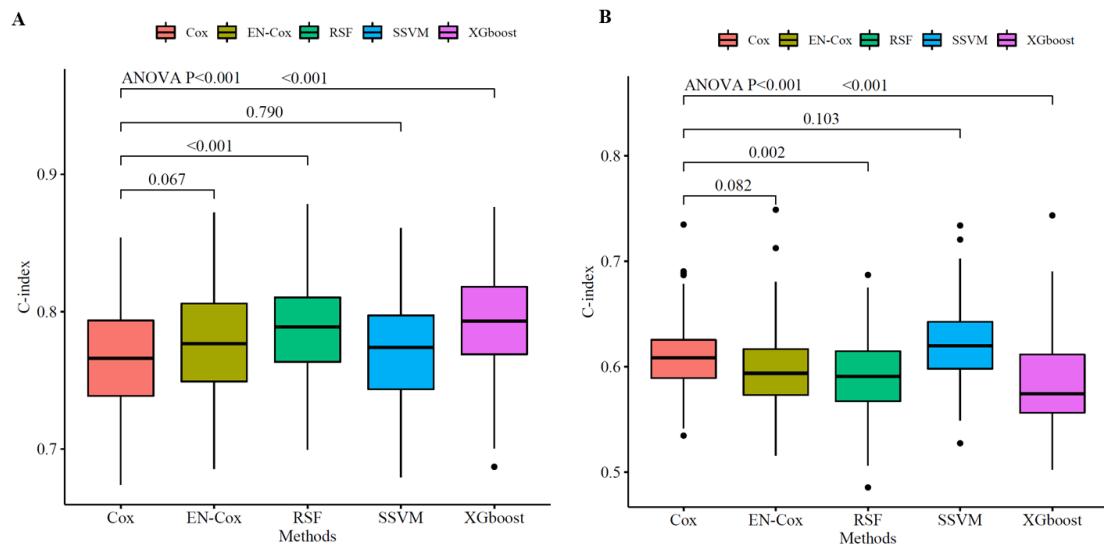

Figure S3. Model interpretability using SHAP values.

A-C respectively represents SHAP summary plot of EN-Cox, RSF, and SSVM model predicting death; D-F represents SHAP summary plot of EN-Cox, RSF, and XGboost model predicting shock.

SHAP, shapley additive explanation; other abbreviations as in Supplemental Tables S1-4.

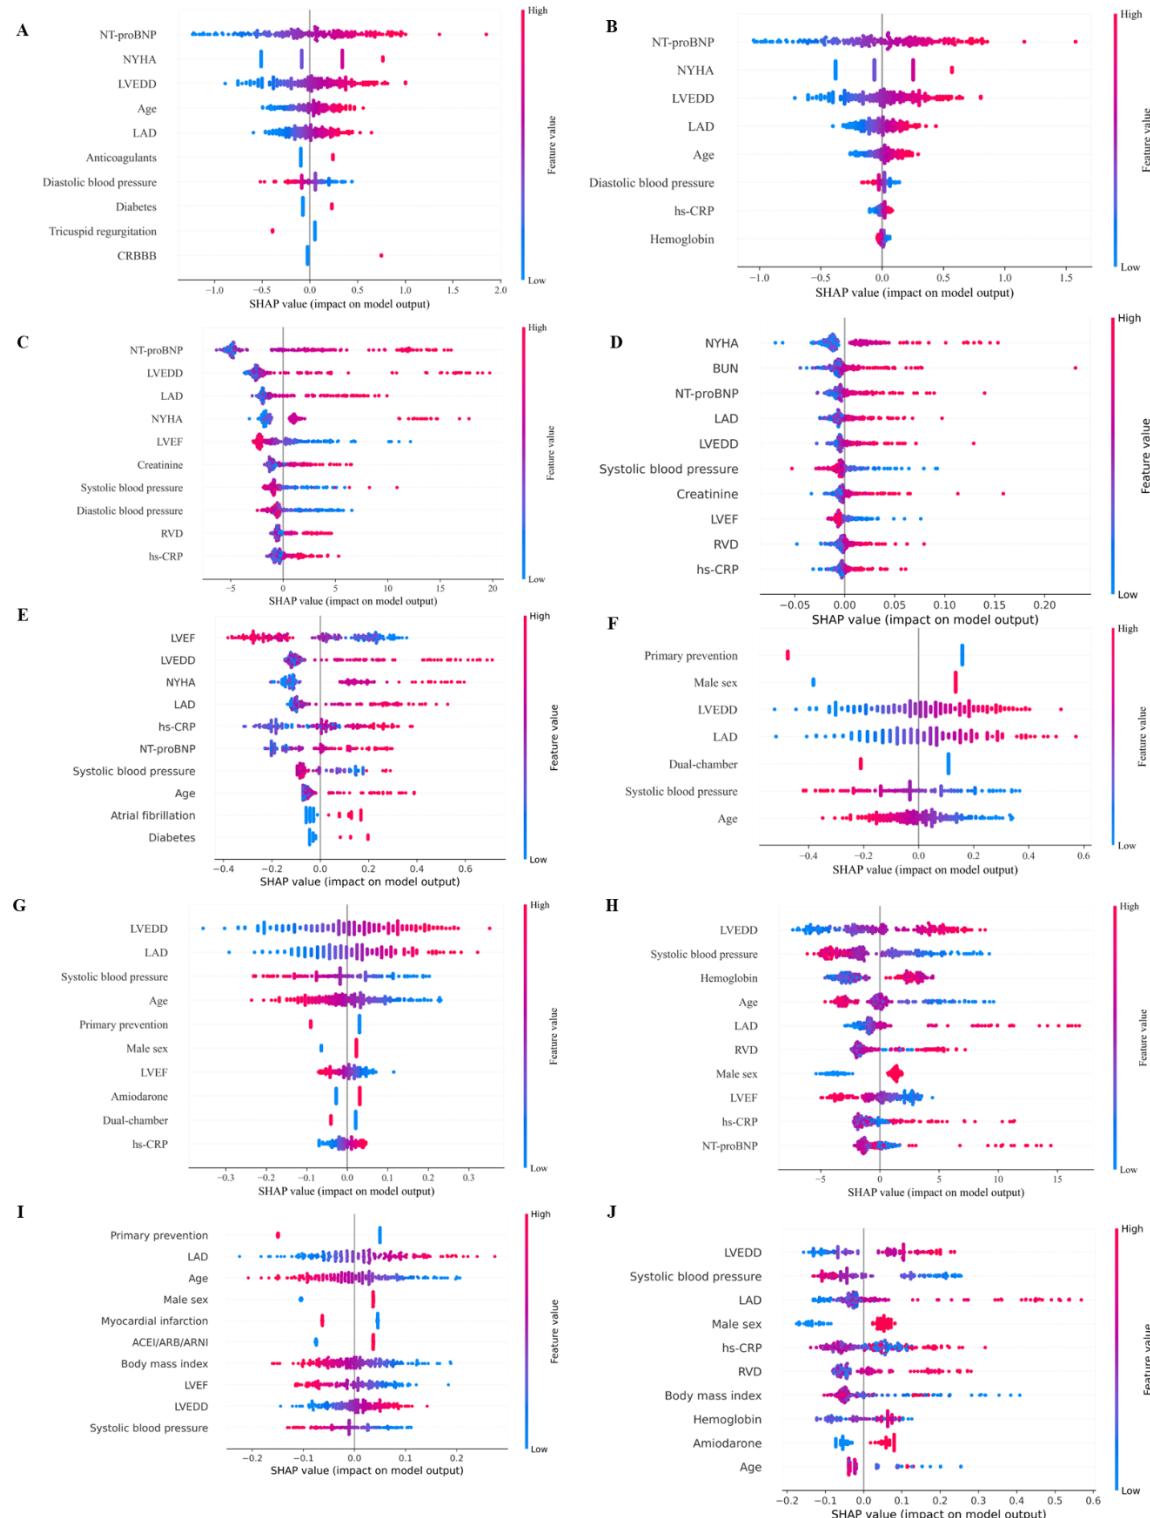

Figure S4. Comparison of C-index between CPH and ML algorithms in sensitivity analysis.

2A and 2B respectively display the comparison of C-index for all-cause death and first appropriate shock in the test set. For predicting all-cause death, the C-index of CPH, EN-Cox, RSF, SSVM, and XGboost were 0.765 (95% CI 0.755-0.773), 0.778 (95% CI 0.770-0.786), 0.787 (95% CI 0.780-0.794), 0.770 (95% CI 0.762-0.778), and 0.790 (95% CI 0.782-0.798), respectively. For predicting shock, the C-index of CPH, EN-Cox, RSF, SSVM, and XGboost were 0.610 (95% CI 0.603-0.617), 0.598 (95% CI 0.590-0.605), 0.591 (95% CI 0.584-0.599), 0.622 (95% CI 0.614-0.629), and 0.584 (95% CI 0.576-0.593), respectively.

CI, confidence interval; other abbreviations as in Supplemental Figure S3 and Table S3.

Figure S5. Model interpretability using SHAP values in sensitivity analysis.

A-E represent SHAP summary plots of CPH, EN-Cox, RSF, SSVM, and XGboost model predicting death; F-J represent SHAP summary plots of CPH, EN-Cox, RSF, SSVM, and XGboost model predicting shock.

Abbreviations as in Supplemental Figure S3, Tables S1-4.
