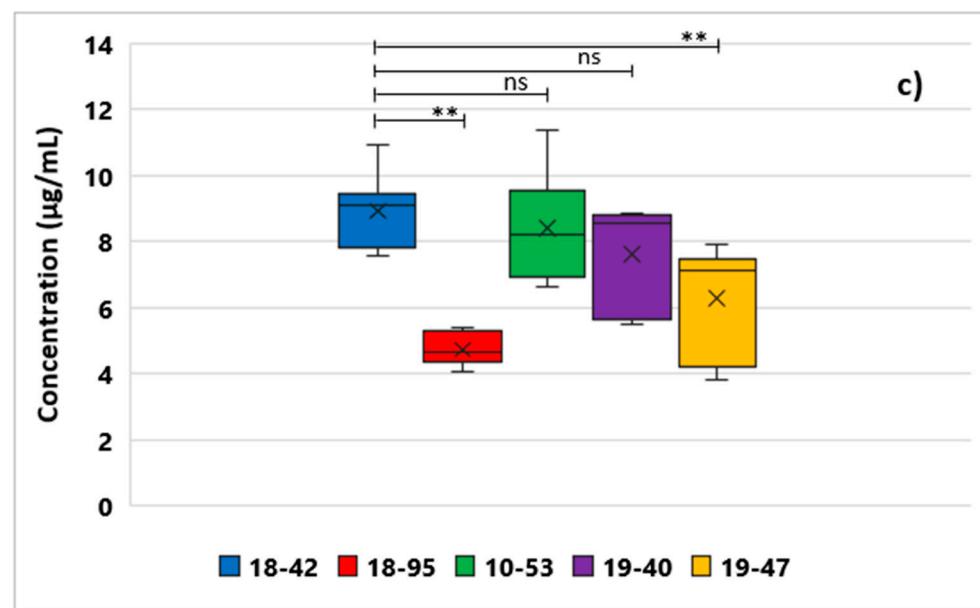

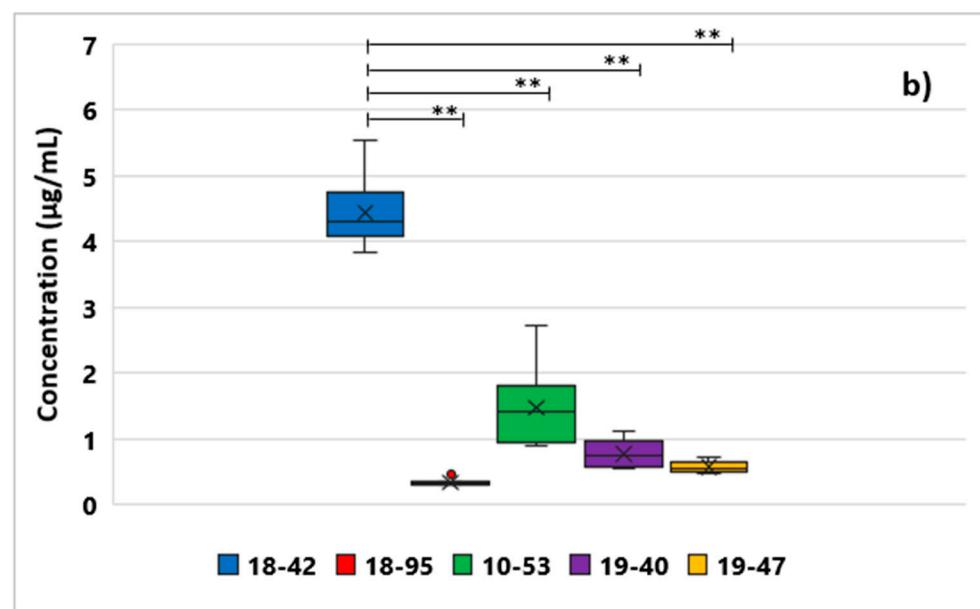

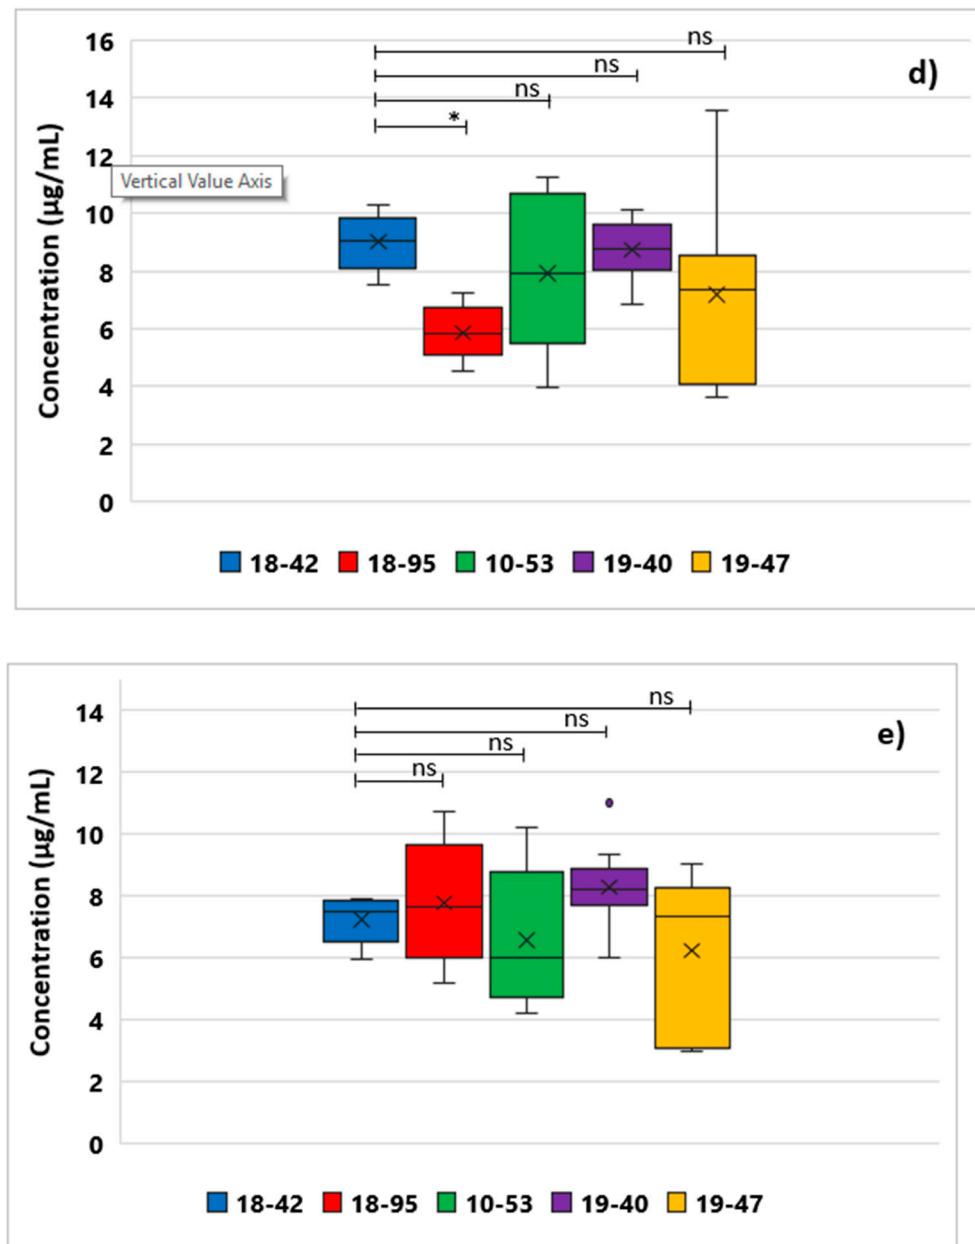

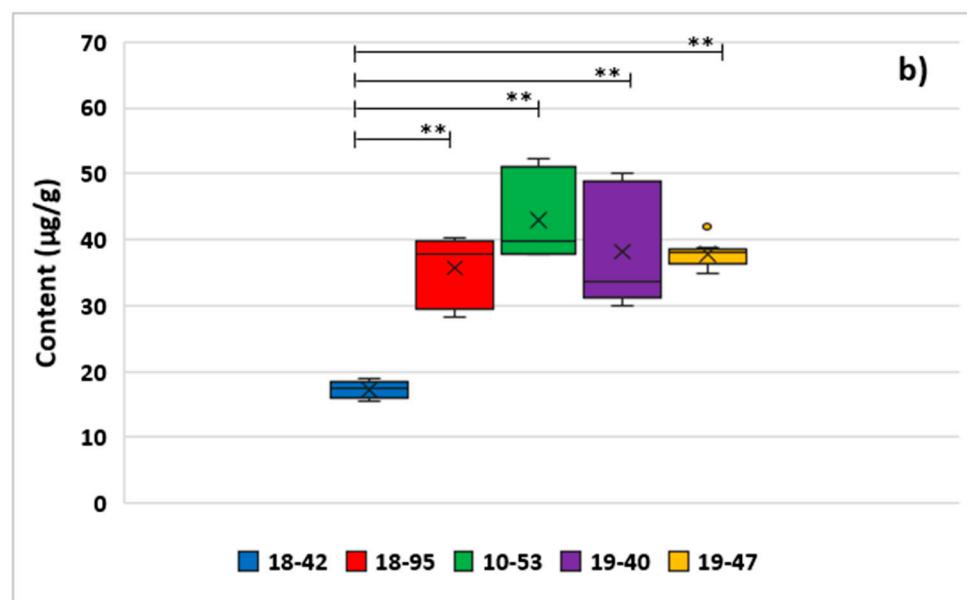

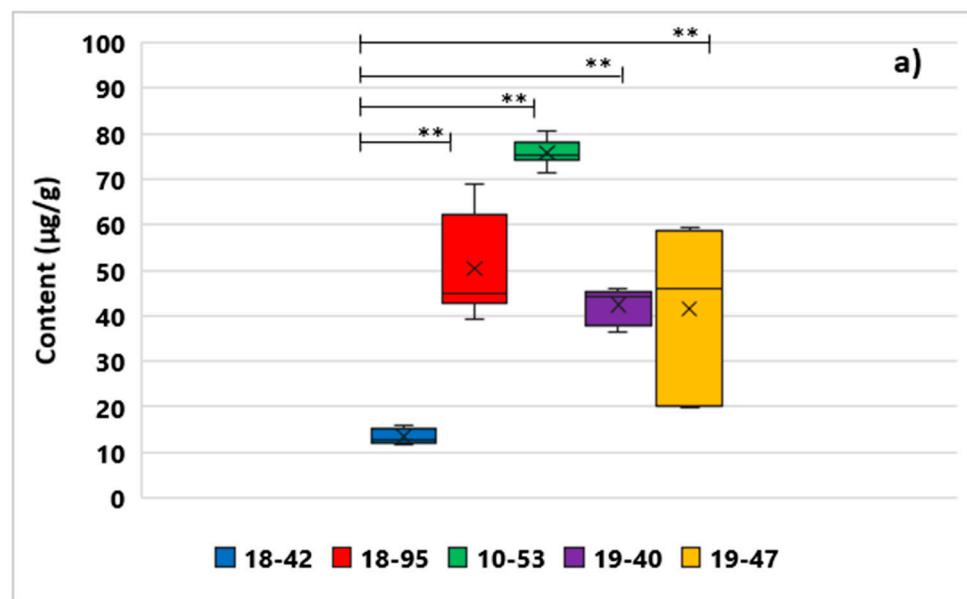

**Figure S1. The variation in TafC concentrations** for VF (18-42) and for non-VF (18-95, 10-53, 19-40, 19-47) *A. fumigatus* strains in fermentation medium collected in (a) 24 h, (b) 31 h, (c) 48 h, (d) 54 h, (e) 72 h. The Kruskal-Wallis One-Way ANOVA with Bonferroni Multiple Comparison results are represented by line segments marked by \* ( $P < 0.05$ ), \*\* ( $P < 0.01$ ),  $n = 9$ .

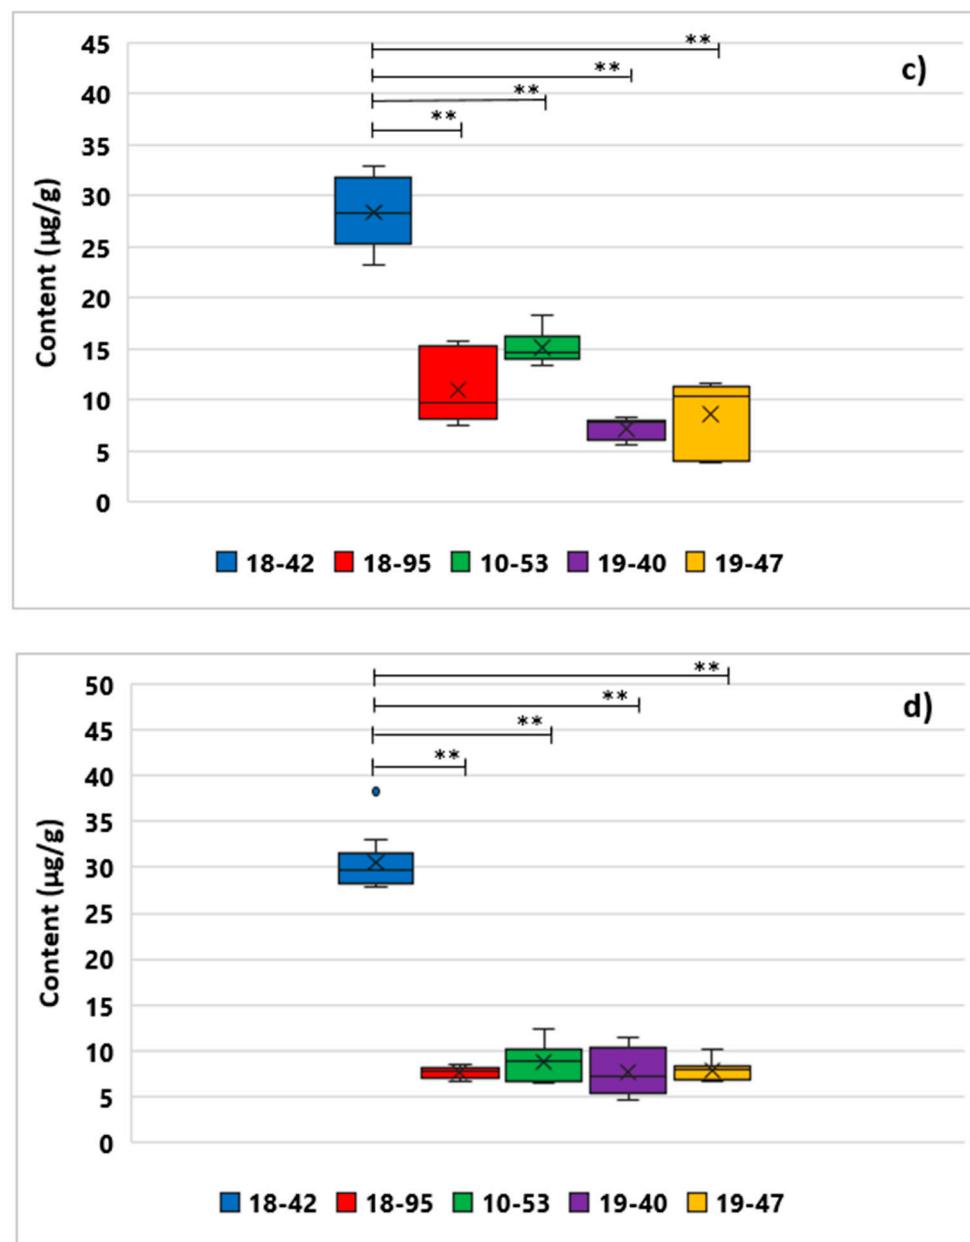

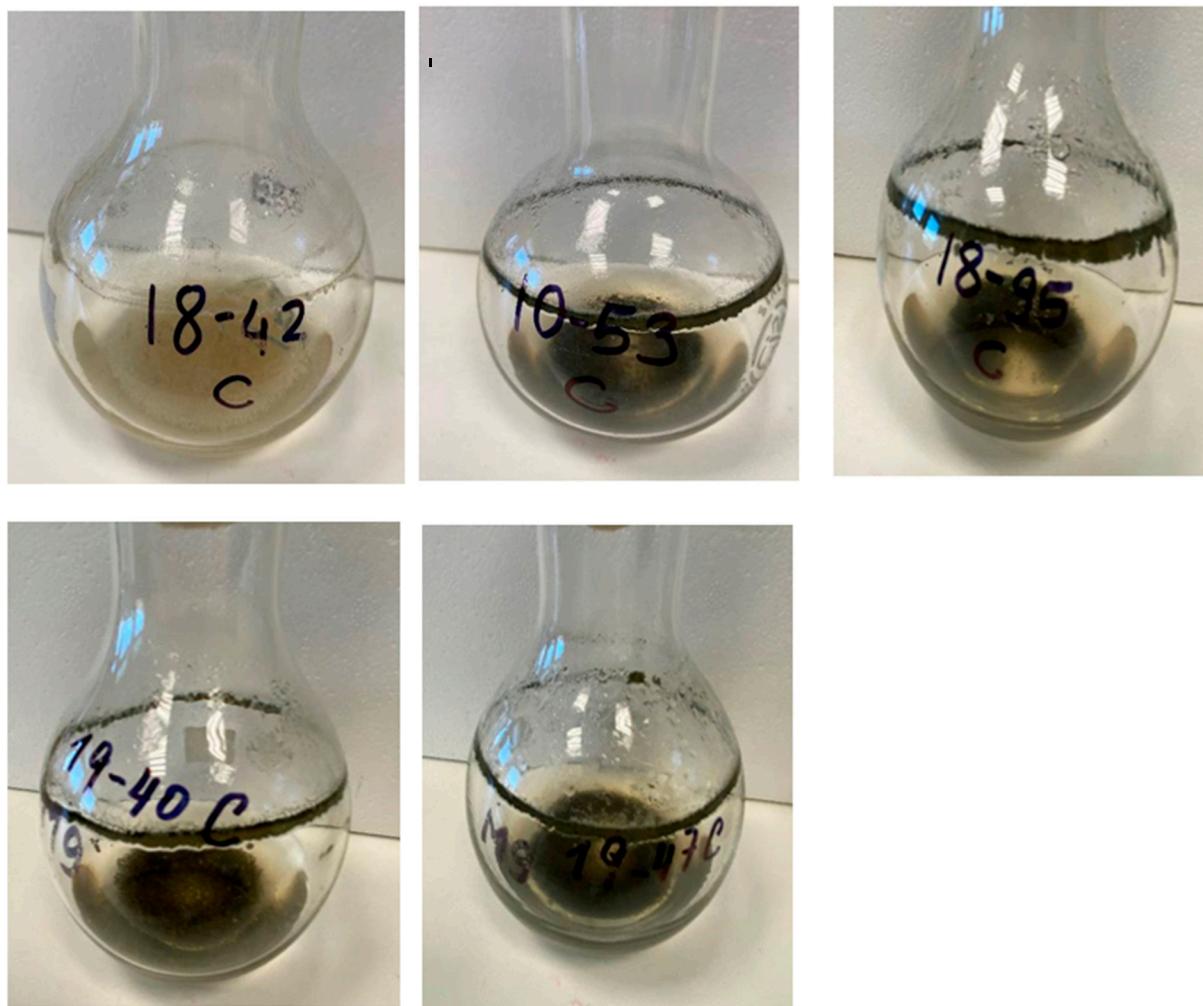

**Figure S2. The variation in extracellular FC concentrations** for VF (18-42) and for non-VF (18-95, 10-53, 19-40, 19-47) *A. fumigatus* strains in fermentation medium collected in (a) 24, (b) 31 h, (c) 48 h, (d) 54 h, (e) 72 h. The Kruskal-Wallis One-Way ANOVA with Bonferroni Multiple Comparison results are represented by line segments marked by \* ( $P < 0.05$ ), \*\* ( $P < 0.01$ ) and ns (statistically insignificant),  $n = 9$ .

**Figure S3.** The variation in FC (a, b) and HFC (c,d) contents for VF (18-42) and for non-VF (18-95, 10-53, 19-40, 19-47) *A. fumigatus* strains in pellets collected in 48 h (a,c) and 52 h (b,d). The Kruskal-Wallis One-Way ANOVA with Bonferroni Multiple Comparison results are represented by line segments marked by \*\* ( $P < 0.01$ ),  $n = 9$ . The similarity in HFC/FC content at both time points is derived from Friedman Q rank test (Supplementary Table S4,  $P < 0.05$ ).

**Figure S4. The pigmentation in VF and VI strains.** *Aspergillus* strains (biological replicate “C”) are displayed from the top to the right in the order: 18-42 (VF), 10-53 (VI), 18-95 (VI), 19-40 (VI), and 19-47 (VI).

**Table S1.** The instrument limits of detection (LODs) and limits of quantification (LOQs).

Analyte	Matrix	LOD	LOQ
TafC	Supernatant	2.6 ng/mL	8.7 ng/mL
FC	Supernatant	3.1 ng/mL	10.4 ng/mL
TafC	Pellet	14.9 ng/g	50.9 ng/g
FC	Pellet	9.6 ng/g	32.9 ng/g
FC/HFC	Conidia	0.3 fg/conidium	0.9 fg/conidium

**Table S2:** Testing the strain and growth phase time effects on siderophore levels. *P* values indicating statistical significance (Friedman's Q Rank Test). The non-statistically significant values returned for the intracellular FC, intracellular HFC and their sum indicated that the growing curve shapes were the same for all five strains and the absolute amounts of the secreted siderophores were not strain dependent.

Siderophore	Friedman Q Rank Test
TafC (extracellular)	0.0228
FC (extracellular)	0.0018
FC (intracellular)	0.1797
HFC (intracellular)	0.6547
Sum of HFC and FC (intracellular)	0.1797

**Table S3.** Statistical differences among extracellular TafC and FC levels in VF and VI strains performed using Kruskal-Wallis One-Way ANOVA with Bonferroni (All-Pairwise) Multiple Comparison. \* -  $P < 0.05$ , \*\* -  $P < 0.01$ , n.s. – not statistically significant.
