

*Supplementary Material*

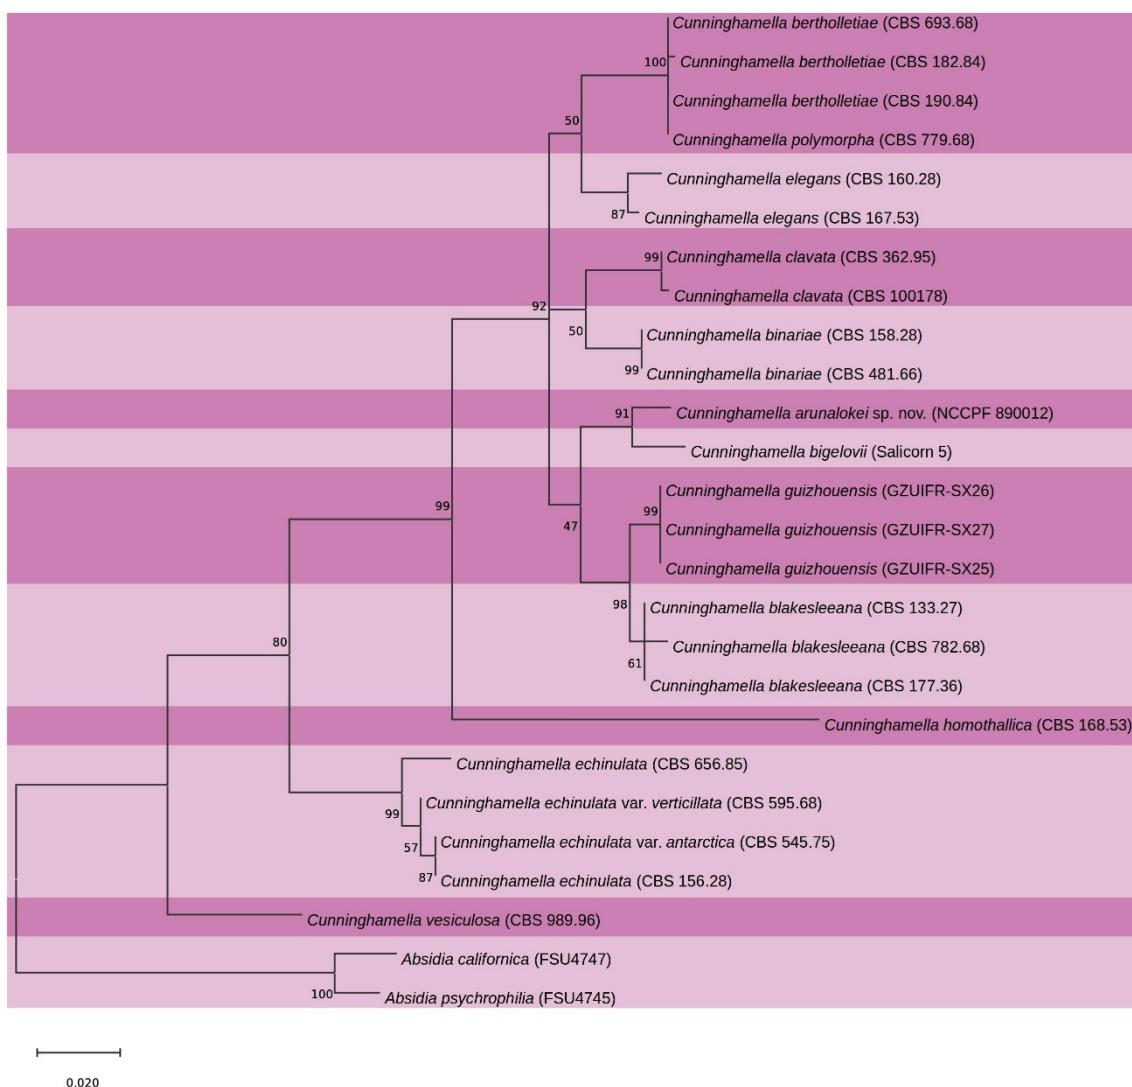

**Figure S1.** Radiological progression of the lesion over the five years (A) lesion in the skin and subcutaneous tissue of left side of the face (2015) (B, C) progression with involvement of the left maxillary sinus mucosa thickening (2016 & 2017) & (D) Intracranial extension in 2021.

**Figure S2:** Molecular phylogenetic analysis of *Cunninghamella* species using internal transcribed spacer region. The evolutionary history was inferred by using the Maximum Likelihood method based on the Kimura 2-parameter model. All positions containing gaps and missing data were eliminated.

**Figure S3:** Molecular phylogenetic analysis of *Cunninghamella* species using 28S large ribosomal subunit region. The evolutionary history was inferred by using the Maximum Likelihood method based on the Kimura 2-parameter model. All positions containing gaps and missing data were eliminated.

**Figure S4.** Molecular phylogenetic analysis of *Cunninghamella* species using EF-1 alpha region. The evolutionary history was inferred by using the Maximum Likelihood method based on the Kimura 2-parameter model. All positions containing gaps and missing data were eliminated.

**Table S1.** Accession numbers of the internal transcribed spacer (ITS) region, large ribosomal subunit (28S) and translation elongation factor-1 alpha (EF-1alpha) of the various *Cunninghamella* species used for phylogenetic analysis in this study.
