S2.6. Computational details for 12a and 12d (NMR)

All the optimized conformers were subjected to Gauge Independent Atomic Orbital (GIAO) calculations of their ^{13}C NMR chemical shifts using density functional theory (DFT) at the mPW1PW91/6-311+G (d, p) level with the PCM model in methanol. The calculated NMR data of these conformers were averaged according to the Boltzmann distribution theory and their relative Gibbs free energy. The ^{13}C NMR chemical shifts for TMS were also calculated by the same procedures and used as the reference. After calculation, the experimental and calculated data were evaluated by the improved probability DP4+ method.
