## Method

X-ray diffraction (XRD) analysis was performed on samples APB1, APB2 and APB3 through a Siemens Kristalloflex Diffractometer equipped with a Cu anode ( $\lambda=1.5418 \text{ \AA}$ ) operating at 40 kV (accelerating voltage) and 30 mA (beam current).

## Results

XRD data are reported in the Tables S1-S3. FWHM conventionally is the Full Width Half Maximum of the diffraction peaks and gives a measure of the energy resolution.

**Table S1.** XRD data for sample APB1.

2-Theta	d(Å)	Height	I/I <sub>0</sub> (%)	Area	FWHM

## Discussion

The XRD patterns of samples APB1, APB2 and APB3 exhibit the main d(Å) values at 3.29, 2.98 (100%), 2.58, 1.83, and 1.56.

The research in XRD databases did not find any correspondence with known antimonates, such as Pb<sub>2</sub>Sb<sub>2</sub>O<sub>7</sub> (JCPDS file 18-687), Pb<sub>2.5</sub>Sb<sub>1.5</sub>O<sub>6.75</sub> (JCPDS file 43-0883), Pb<sub>3+x</sub>Sb<sub>2</sub>O<sub>8+x</sub> (JCPDS file 34-1196), and PbSb<sub>2</sub>O<sub>6</sub> (JCPDS file 34-0912), this last being the compound named rosielite often found in combination with Pb<sub>2</sub>Sb<sub>2</sub>O<sub>7</sub> also in artworks [18].

All these compounds were found in yellow samples prepared without the addition of NaCl or C<sub>4</sub>H<sub>5</sub>KO<sub>6</sub>.

As a consequence of this result, we may suppose that the addition of sodium chloride caused the production of Pb/Sb compounds incorporating also Na and Cl whose composition is not known or no XRD pattern is present in the JCPDS database.
