Message from the Guest Editor

Dear Colleagues,

Alzheimer’s disease (AD)—a progressive, neurodegenerative, and incurable disorder—is the most common form of dementia diagnosed in people over the age of 65. AD looms as a major threat to public health in the first half of the 21st Century. Dementia doubles in frequency every five years after age 60, afflicting 1% of those aged 60–64 but rising to 30-40% of those 85 years and older.

The primary goals of this Special Issue on “Alzheimer’s Disease Imaging Biomarkers” are to recount the history of AD imaging breakthroughs, present ongoing cutting edge research, and introduce novel ideas that will advance the field. The Special Issue will include invited and solicited submissions. We welcome your contribution.

With warmest regards,

Prof. Dr. Jonathan J. Wisco
Guest Editor

Author Benefits

Open Access: free for readers, with publishing fees paid by authors or their institutions.

High visibility: Indexed in the Emerging Sources Citation Index (ESCI - Web of Science), EMBASE (Elsevier) and Chemical Abstracts (CAS). Full-text archived in PubMed Central, citations forthcoming in PubMed.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 33 days after submission; acceptance to publication is undertaken in 8 days (median values for papers published in this journal in 2016).
