Message from the Guest Editor

Dear Colleagues,

Fertilizer use in eucalyptus and pine plantations has trends, which are similar to some agricultural production systems, mainly in tropical and subtropical areas. The knowledge base for the nutritional diagnosis and the development of fertilizer prescriptions that optimize production are relevant questions that drive research in several countries regarding tree species. However, there is a lack of information about ecophysiological answers and their relationship with fertilizer prescriptions. This Special Issue focuses on research results and methods for nutritional diagnosis and fertilizer prescriptions and their effects on ecophysiological properties in Eucalyptus and Pine plantations.

Author Benefits

- **Open Access:** free for readers, with publishing fees paid by authors or their institutions.
- **High visibility:** indexed by the Science Citation Index Expanded (Web of Science), EI Compendex, GeoBase, Scopus and other databases.
- **Rapid publication:** manuscripts are peer-reviewed and a first decision provided to authors approximately 29 days after submission; acceptance to publication is undertaken in 7 days (median values for papers published in this journal in 2016).
