Special Issue

Volcanic Plumes: Impacts on the Atmosphere and Insights into Volcanic Processes

Message from the Guest Editors

Dear Colleagues,

Volcanoes release plumes of gas and ash to the atmosphere, during episodes of passive and explosive behaviour. These ejecta have important implications for the composition of the troposphere and stratosphere, with the capacity to alter Earth’s radiation budget and climate over a range of spatiotemporal scales. The chemical composition and emission rate of volcanic plumes are also monitored, via a range of direct sampling and remote sensing instrumentation, in order to gain insights into subterranean processes, in respect of the magmatic bodies these volatiles exsolve from.

This Special Issue is aimed at presenting state of the art, multi-disciplinary science concerning all aspects of volcanic plumes, of relevance to the volcanology, climatology and atmospheric science communities.

We invite you to submit your manuscripts. Both research articles and reviews will be considered for publication.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High visibility: Indexed in the Emerging Sources Citation Index (ESCI - Web of Science), Scopus and other databases.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 32 days after submission; acceptance to publication is undertaken in 9.5 days (median values for papers published in this journal in 2016).
