Deadline for manuscript submissions: 15 July 2018

Message from the Guest Editor

Dear Colleagues,

The pivotal roles of TGF-β superfamily members, including TGF-βs, nodal, activins, BMPs, and GDFs, in pathological processes are discussed in this Special Issue.

TGF-β superfamily members play key roles throughout development and later in adult homeostasis to orchestrate complex processes. Consistent with their diverse functions, aberrant signaling by members of the TGF-β superfamily is associated with a wide range of human pathologies, including immune system compromise, cardiovascular and fibrotic diseases, aging processes and, critically, cancer. The knowledge of this superfamily is expanding into previously uncharted areas of biology and human pathogenesis. This Special Issue is focused on the mechanisms of aberrations in this signaling pathway, which lead to human disease pathologies.

Topics include vasculature and tissue transformation, tissue microenvironment dynamics, inflammation, and therapeutic frontiers of TGF-β signaling.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science), MEDLINE (PubMed) and other databases.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 20 days after submission; acceptance to publication is undertaken in 6 days (median values for papers published in this journal in first half of 2017).
