Deadline for manuscript  
submissions:

**closed (15 September 2018)**

### **Message from the Guest Editors**

Dear Colleagues,

Invertebrate pest control within both agricultural and horticultural production systems continues to present many challenges. For the application of sustainable and efficient control treatments it is necessary to have accurate knowledge of pest population numbers. Equally, it is vital to be aware of beneficial populations within a given ecosystem. This special issue will include original research articles and reviews by leading research entomologists and associated experts. Articles will focus on the latest developments in monitoring and trapping of various major agricultural and horticultural invertebrate pests (both indigenous and invasive species) and on the advances made in regards to use of such systems in controlling their populations.

Dr. Andrew G. S. Cuthbertson

Dr. Archie K. Murchie
