New Insight into Cardiovascular Disease in Elderly People

Guest Editors:

Message from the Guest Editors

Dr. Lorenzo Fácila

Dear Colleagues,

Dr. Clara Bonanad

Dr. Albert Ariza-Sole

Deadline for manuscript submissions:

31 July 2024

Cardiovascular diseases are frequent among elderly patients. It is estimated that 70% of the population over 70 will develop cardiovascular diseases. People older than 65 are more likely to suffer acute coronary syndrome, experience a stroke, or develop coronary artery disease and heart failure. The geriatric population has grown worldwide in recent decades because life expectancy has increased significantly. However, the aged population is underrepresented in clinical trials, and current clinical practice guidelines do not include recommendations. They are also a heterogeneous group that ranges from robust and independent individuals to those who may experience additional complications such as polypharmacy, frailty, comorbidities, or inflammation.

Thus, in this Special Issue, we welcome contributions focused on various domains related to cardiovascular disease in the elderly, in order to improve the management of elderly patients with acute coronary syndrome and other cardiovascular diseases.
