Message from the Guest Editors

Dear Colleagues,

Ocean waves play a direct role in defining hydrodynamic, sediment transport, and morphodynamic characteristics of coasts and estuaries. In addition, they can play an indirect role through wave-current interaction. As a result, stability and integrity of coastal and estuarine systems are directly linked to local wave conditions prevailing in these systems. Additionally, waves can have a significant impact on marine ecosystem dynamics, pollutant transport and ecosystem services. This Special Issue will provide a collection of research articles on the advances in modeling, analyses and forecasting of waves in coastal and estuarine systems.

Author Benefits

| **Open Access:** free for readers, with publishing fees paid by authors or their institutions. |
| **High visibility:** indexed in INSPEC (IET); to be added in Scopus from Vol. 5. |
| **Rapid publication:** manuscripts are peer-reviewed and a first decision provided to authors approximately 31 days after submission; acceptance to publication is undertaken in 12 days (median values for papers published in this journal in 2016). |
