Special Issue

Corrosion of Magnesium Alloys

Message from the Guest Editors

Dear Colleagues,

Magnesium alloys, given their high strength-to-weight ratio, are very attractive materials for applications. However, magnesium alloys have not found widespread application, particularly in the corrosive environment, because of their unacceptably rapid corrosions. Thus, there is a great commercial value in finding measures for durable corrosion resistance of magnesium alloys. It may be intriguing that, because of the susceptibility of magnesium to corrosion, and the corrosion products of magnesium being non-toxic, there has been recent and increasing interest in these alloys for manufacturing biodegradable temporary implants. With this background, this Special Issue invites contributions from academia, researchers, industry professionals and engineers on the following aspects:

• Corrosion mechanics and corrosion-assisted fracture of magnesium alloys
• Measures for mitigation of corrosion of magnesium alloys
• Application of magnesium alloys including in novel fields, such as bioimplants

Author Benefits

Open Access: free for readers, with low publishing fees paid by authors or their institutions.
High visibility: indexed by the Science Citation Index Expanded (Web of Science) and other databases.
Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 21 days after submission; acceptance to publication is undertaken in 7 days (median values for papers published in this journal in 2016).
