Message from the Guest Editors

Dear Colleagues,

Hypervalent iodine chemistry has matured over several decades, with many transformations mediated by hypervalent iodine compounds now being commonplace in synthesis. In particular, the ability to use these species in place of expensive or toxic metal salts is appealing. They have been used as stoichiometric oxidants, as functional group transfer agents, and as sources of radicals and carbenes. Recent advances include the development of enantioselective processes with chiral hypervalent iodine compounds and the realisation of catalytic reactions with in situ generated hypervalent iodine species.

This Special Issue will focus on the latest developments in hypervalent iodine chemistry in all areas of synthesis.

Author Benefits

Open Access: free for readers, with publishing fees paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science), MEDLINE (PubMed) and other databases.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 19 days after submission; acceptance to publication is undertaken in 6 days (median values for papers published in this journal in 2016).

Sections: published in twelve topical sections.
